# Outline

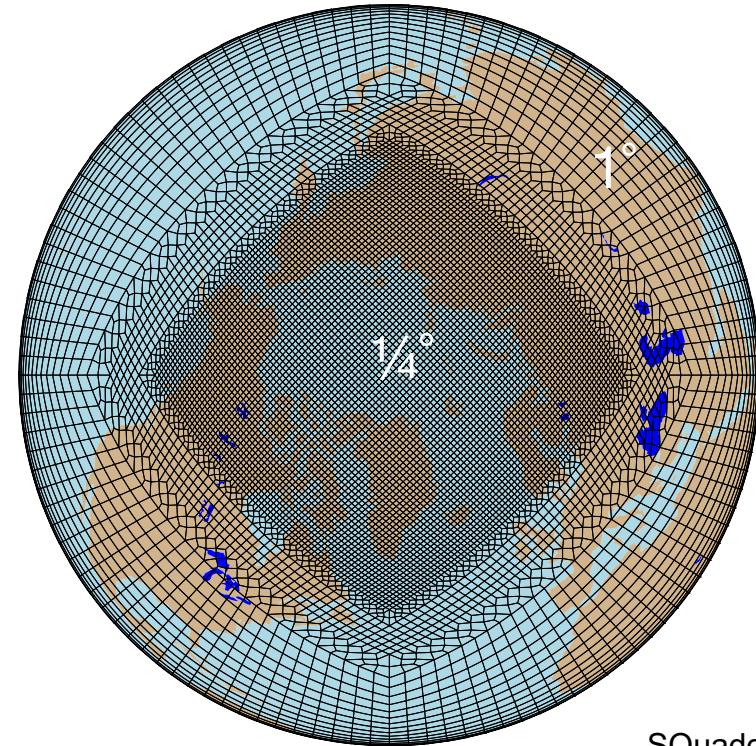

Coupling the Arctic grid to 1° POP2 in CESM2.2:

- Challenges, e.g., tuning
- piControl climate
- 1pctco2 experiment
- Greenland Ice Sheet in CISM and its response

Compare to CMIP6 1° workhorse (CESM2.1)

- piControl (Lofverstrom et al 2020)
- 1pctco2 (Muntjewerf et al 2020)

‘Arctic’ grid  
(Herrington et al., 2022, JAMES)

SQuadgen, P. Ullrich

Since the atmosphere is higher-resolution than the ocean, we compute the surface fluxes on the atmosphere grid

# Challenges with Variable-Resolution (VR) Grids

Two orthogonal problems with conventional physics packages:

## (1) Inadequate scale awareness

- Not much we can do about this except to avoid refining regions with lots of diabatic forcing and vertical motion

## (2) Large sensitivity to physics time-step

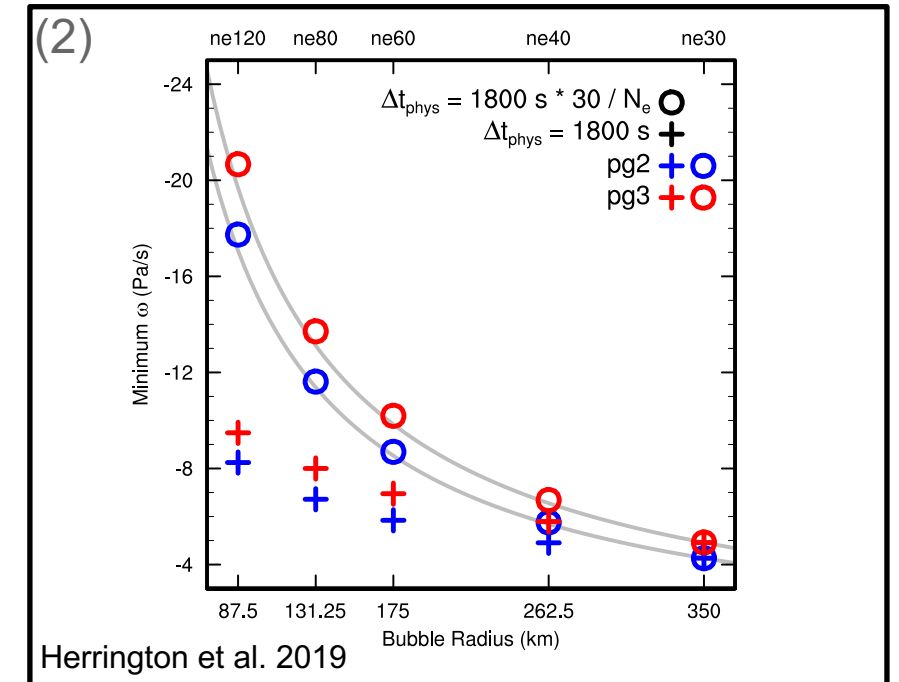

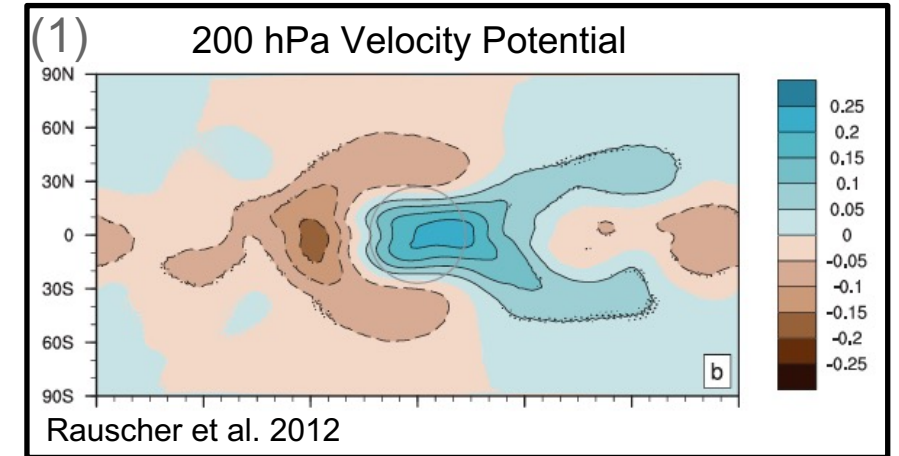

- We could run with the 1° physics time-step to avoid re-tuning from (2), but solution accuracy is reduced substantially.

Tune by proxy – tune the 1° model using the (small) VR time-step

### Estimated cost of tuning

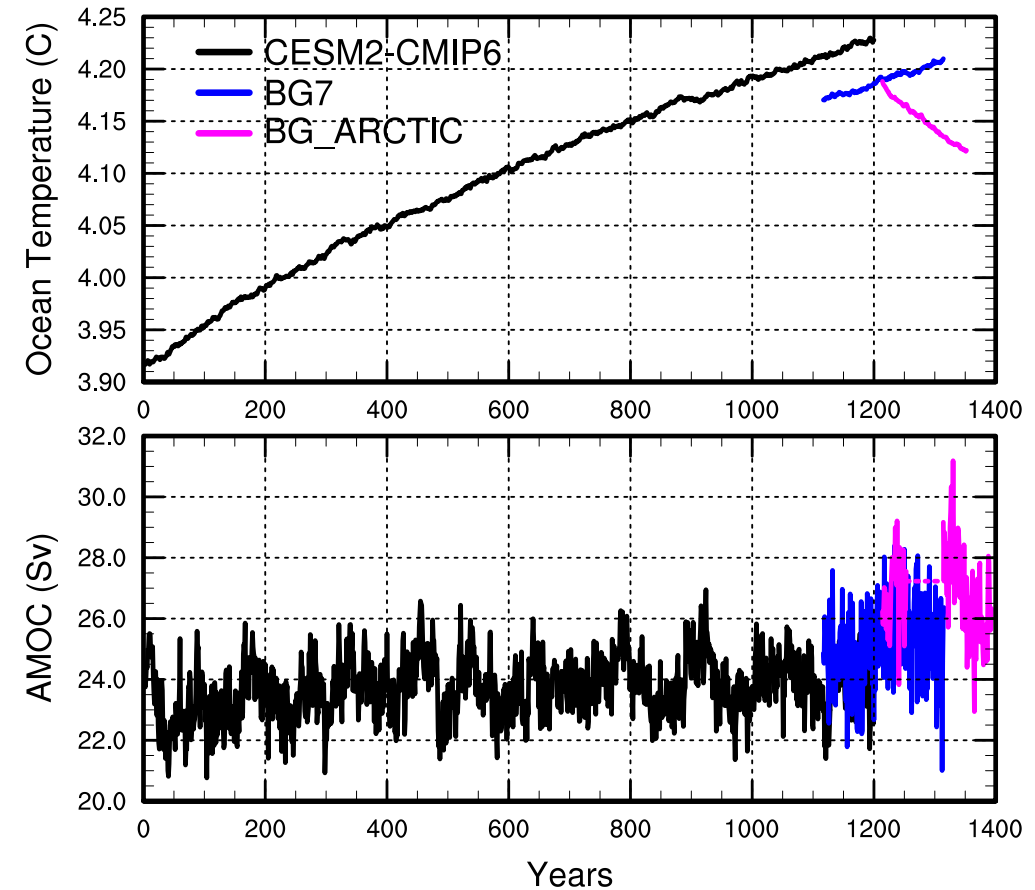

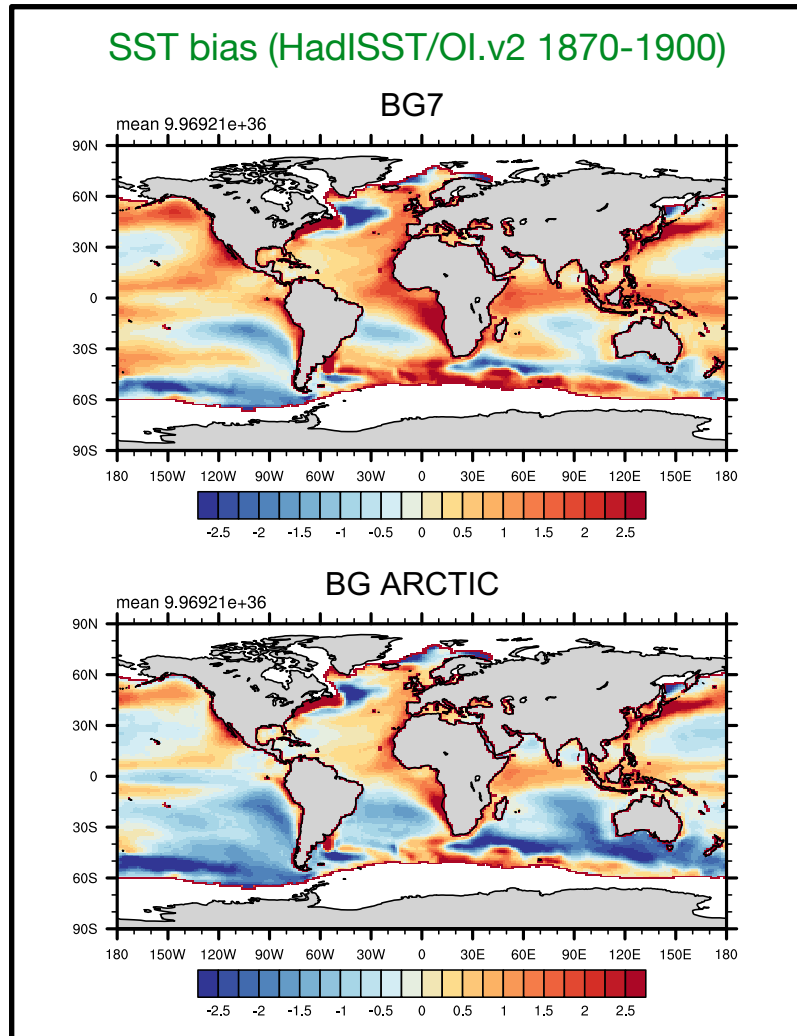

- Prioritize balanced RESTOM, reasonable cloud cover and SSTs
- About 20 x 10 year simulations + a couple 20 year simulations
- \*3 times more expensive than 1° ~ **1.5-2 M core hours**

\*the Arctic grid is 10 times more expensive than 1°

# Preindustrial Control

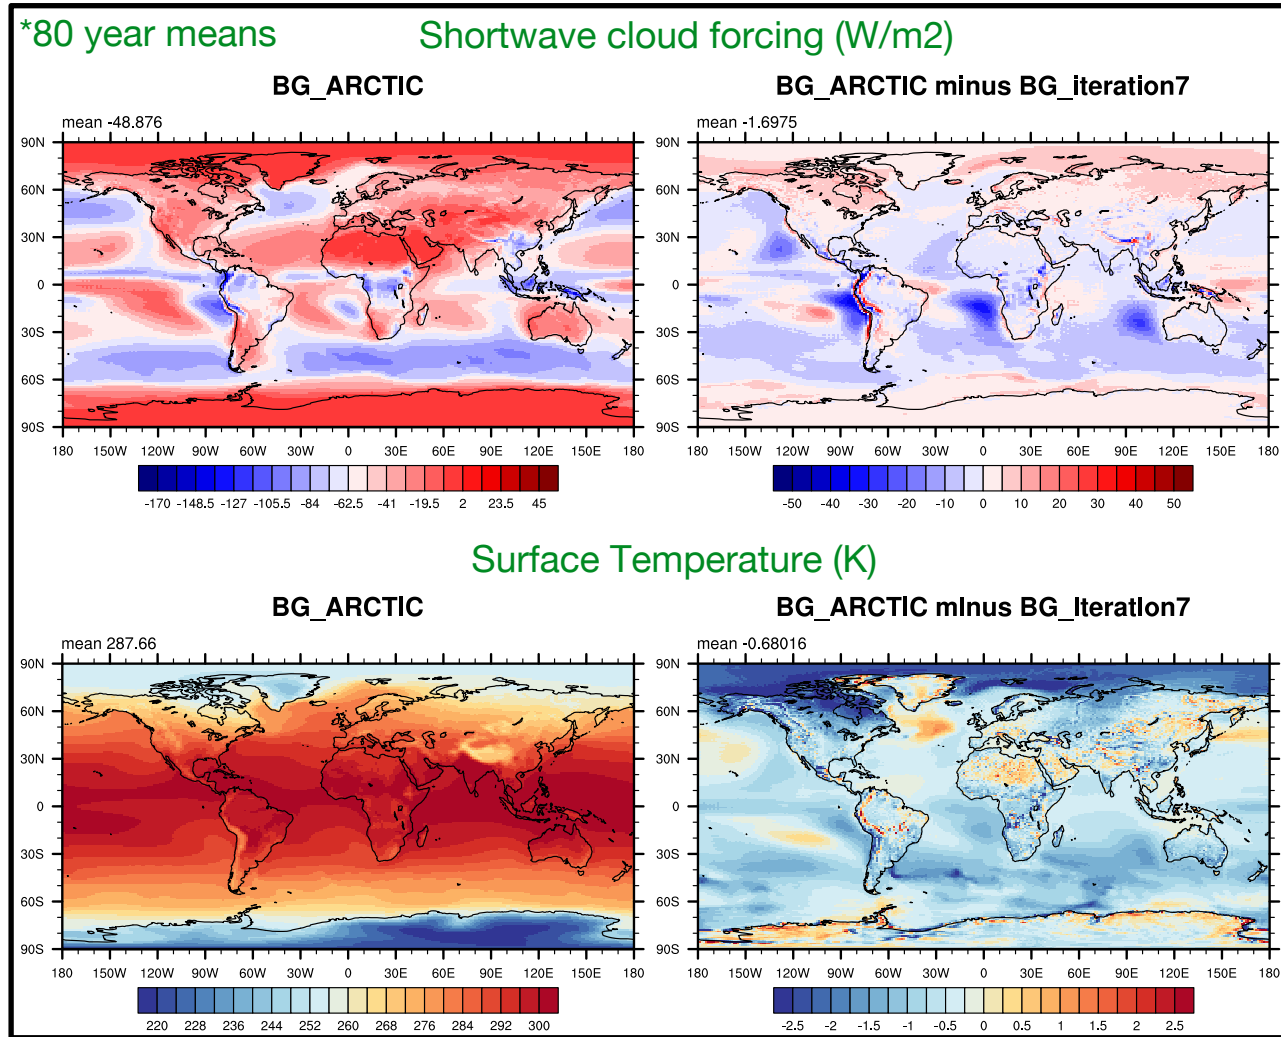

CISM is on; **BG ARCTIC** is branched from the **BG7 control** of Lofverstrom et al. 2020

2-3 W/m<sup>2</sup> reduction is SW absorbed by ocean  
(not shown)

# Preindustrial Control

Comparing **BG ARCTIC** to **BG7**

2-3 W/m<sup>2</sup> reduction is SW absorbed by ocean  
(not shown)

# Preindustrial Control

Comparing **BG ARCTIC** to **BG7**

\*80 year means

BG\_ARCTIC

AMOC (Sv)

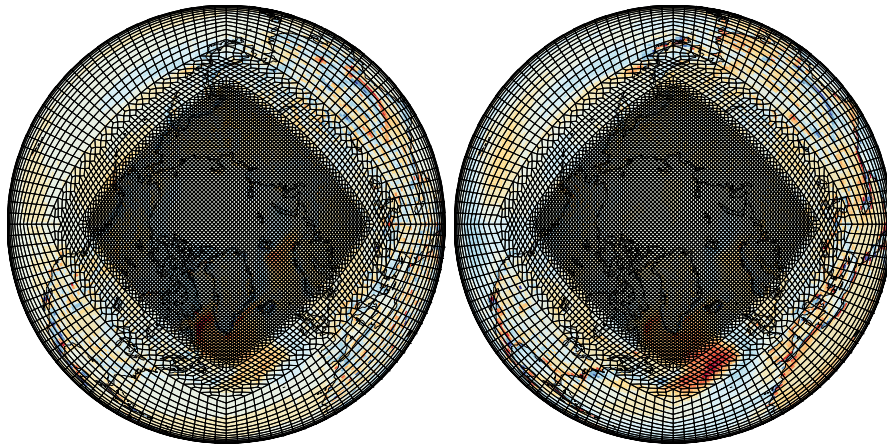

BG\_ARCTIC minus BG\_iteration7

BG\_ARCTIC minus BG\_iteration7

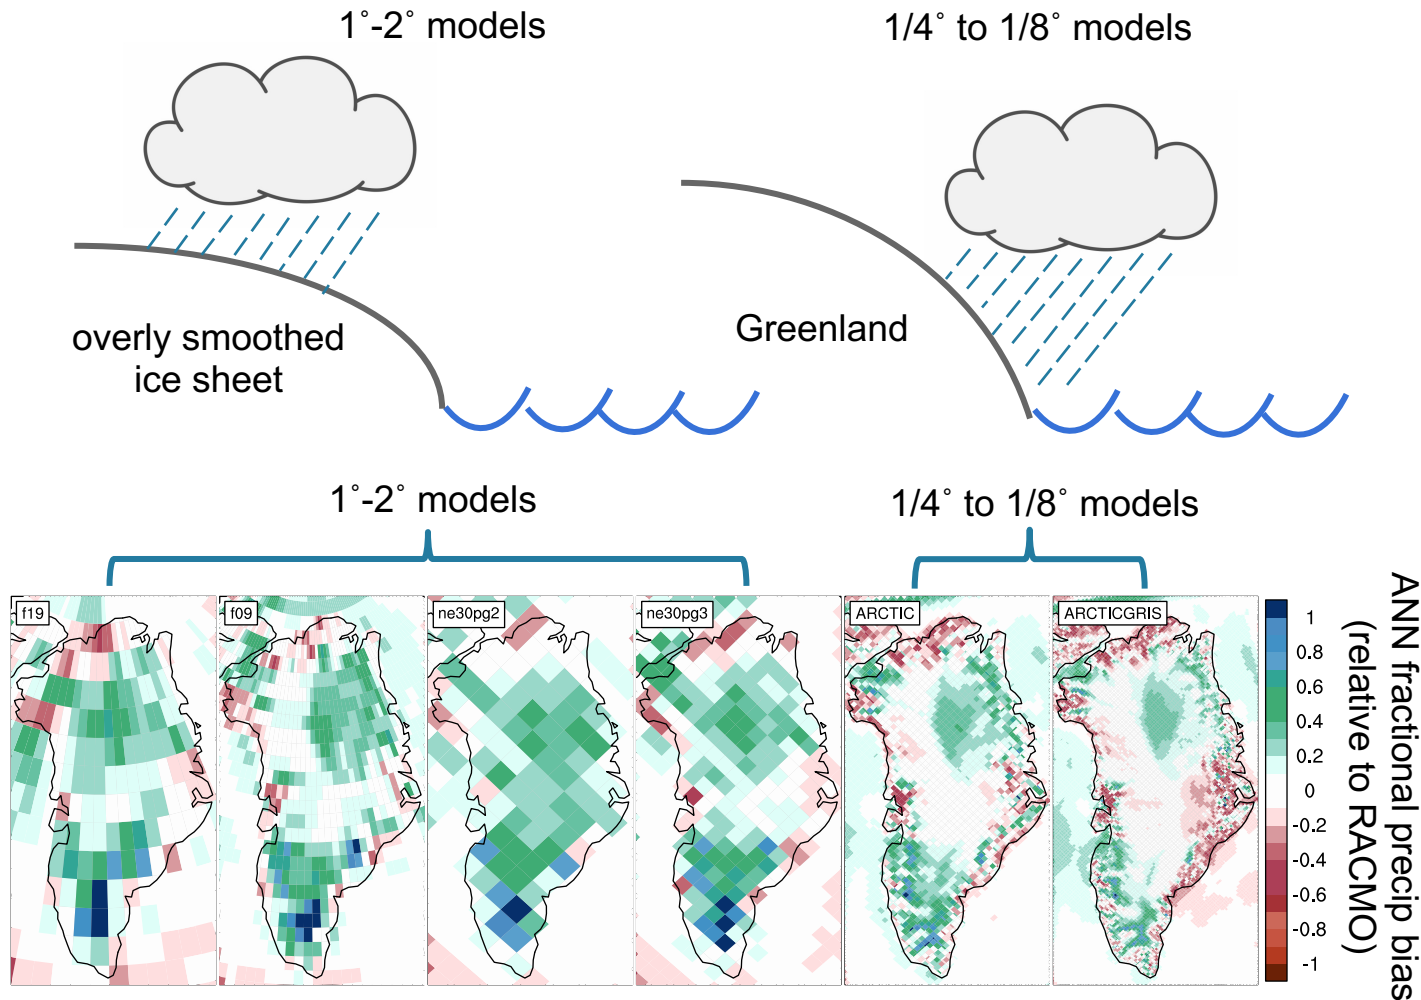

Sensible Heat Flux (W/m<sup>2</sup>)

Latent Heat Flux (W/m<sup>2</sup>)

# Greenland clouds / precipitation sensitive to resolution

1-2° models are missing clouds around the coastlines, and the interior is too cloudy

Herrington et al. 2022, JAMES

# Greenland clouds / precipitation sensitive to resolution

1-2° models are missing clouds around the coastlines, and the interior is too cloudy

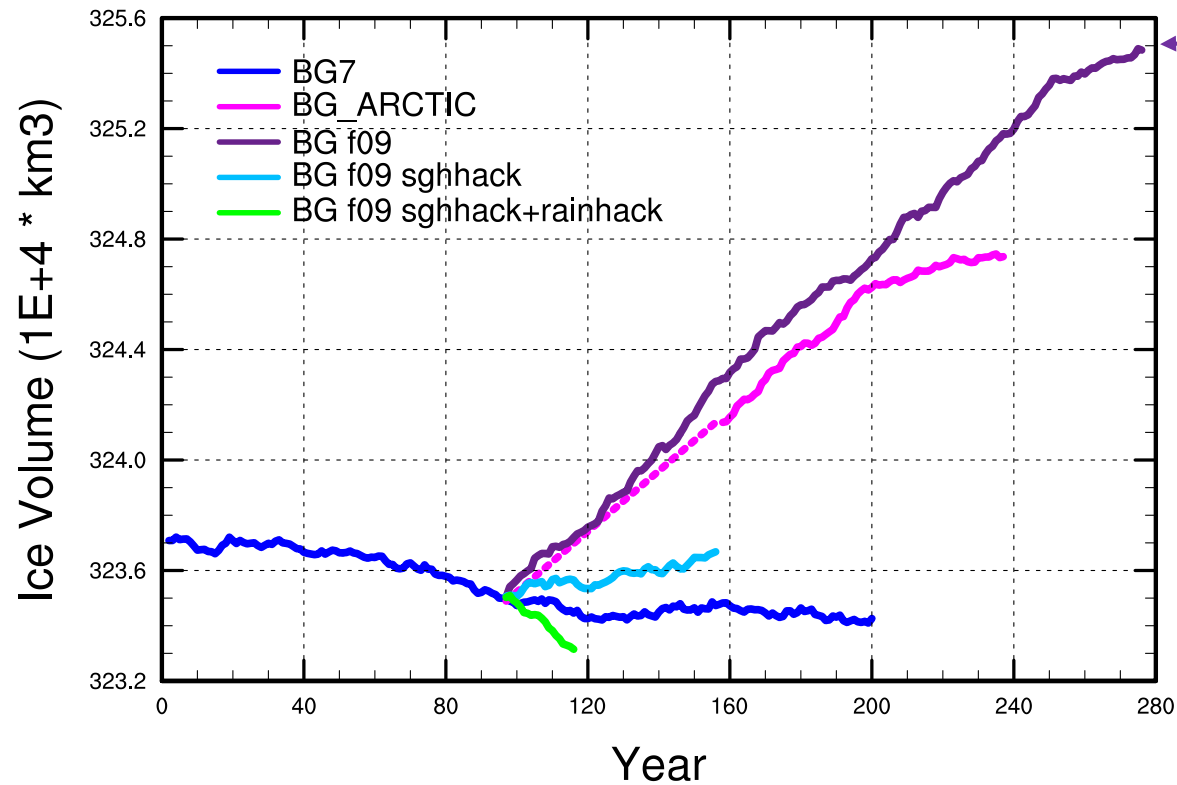

**BG7** uses 1° FV dycore; employs creative methods for reducing GrIS precip. bias

# Preindustrial Control – Greenland Ice Sheet

Still spinning up  
re-do 1pctco2 exp of  
Muntjewerf et al

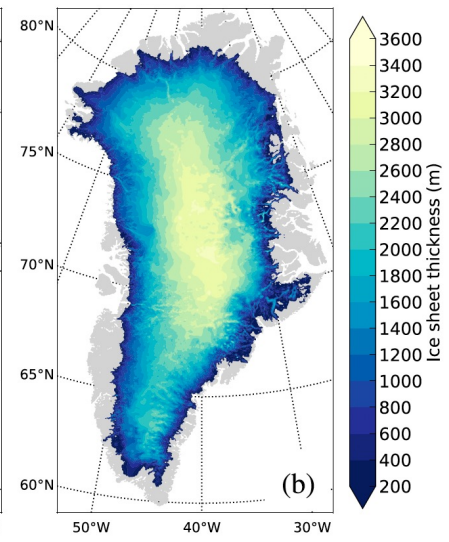

BG ARCTIC

BG7

Observations

Thanks also to Miren Vizcaino and Kate Thayer-Calder for help with reproducing these results

Morlighem et al. 2014

# Idealized Warming Experiment

1%CO<sub>2</sub>/yr; hold fixed at 4XCO<sub>2</sub>

Compare to **f09** in Muntjewerf et al. (2020)

First results: lower TCR\*

- **f09**: 1.95 K
- **ARCTIC**: 1.65 K – 1.78 K

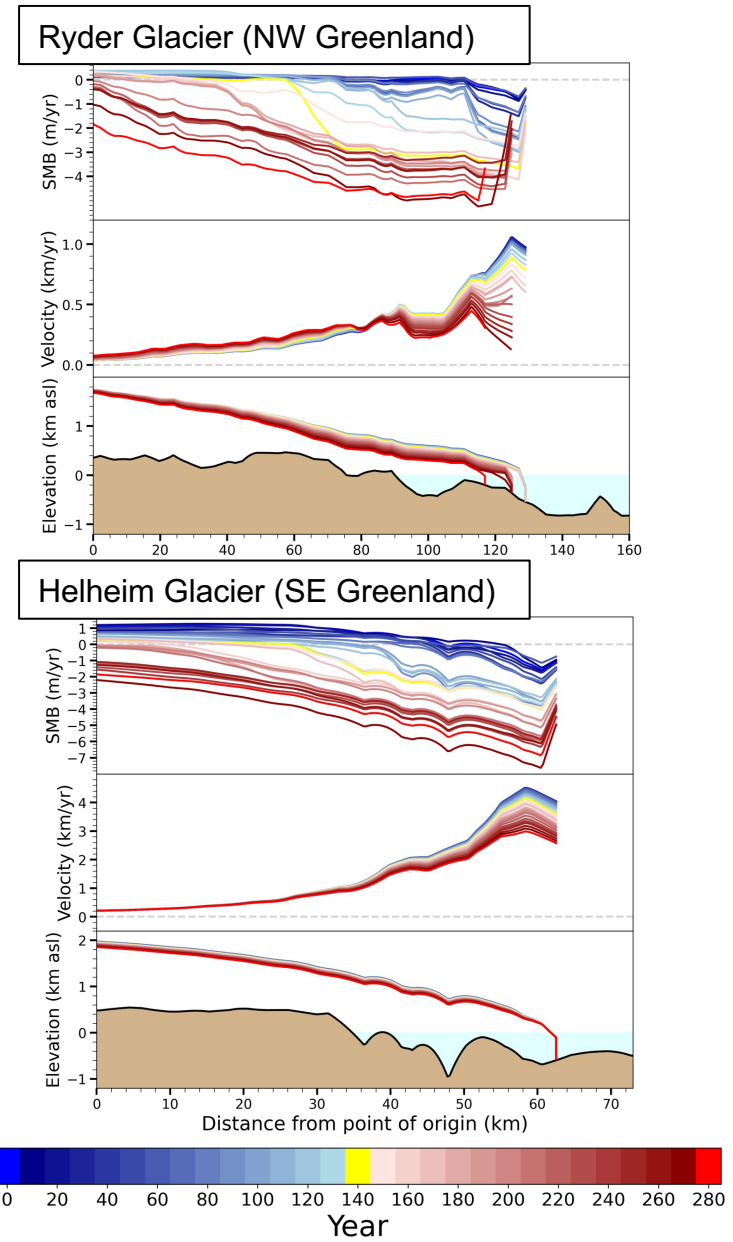

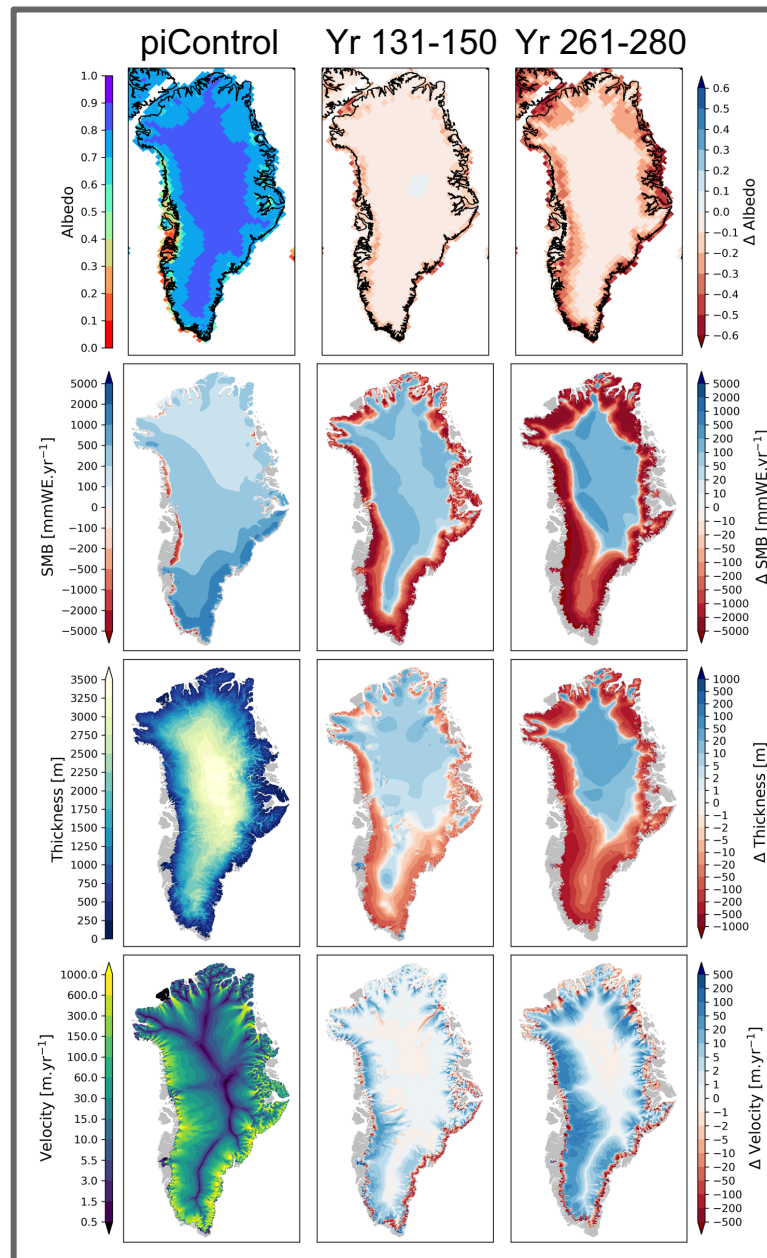

\*Transient Climate Response (TCR) is the avg sfc temperature change in the 20-year period when the CO<sub>2</sub> concentration doubles in a 1%CO<sub>2</sub> experiment

# GrIS response in BG ARCTIC

## A question to think about

- Is there community interest in “this” being “supported”
  - anyone can check out <https://github.com/ESCOMP/CESM> and reproduce my results
  - anyone can check out <https://github.com/ESCOMP/CESM> and run this configuration (outdated tunings as the code base is well into transition to CAM7/CESM3)
- Supporting a POP2 configuration is not very forward looking
  - We will begin coupling the DUAL POLAR grid to MOM6 later this year

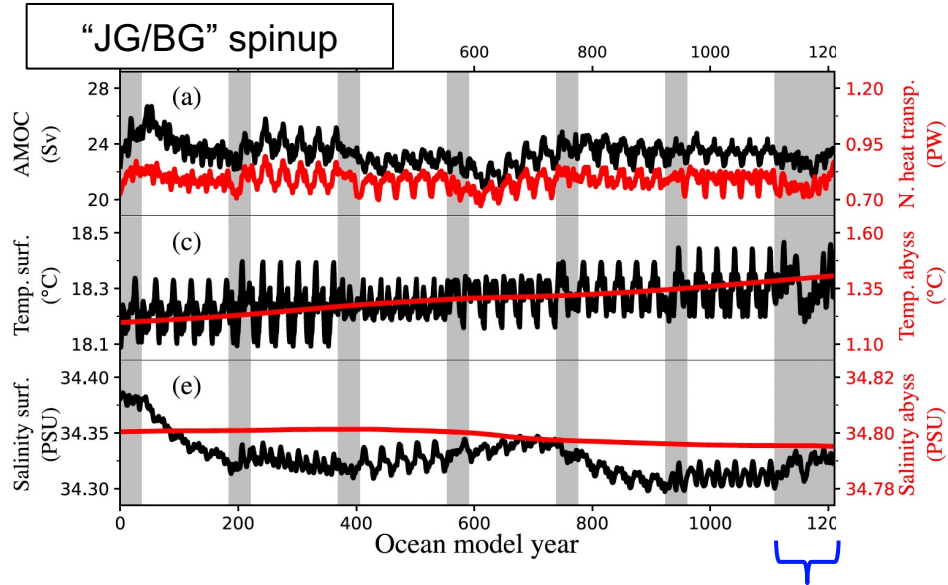

# Extra Slides

# Preindustrial Control

CISM is on; branch from **BG7 control** (Lofverstrom et al. 2020)

1° FV dycore

**BG ARCTIC** (this study)

10X more expensive  
(30k core hrs / sim. yr.)

**BG7 = BG iteration 7**

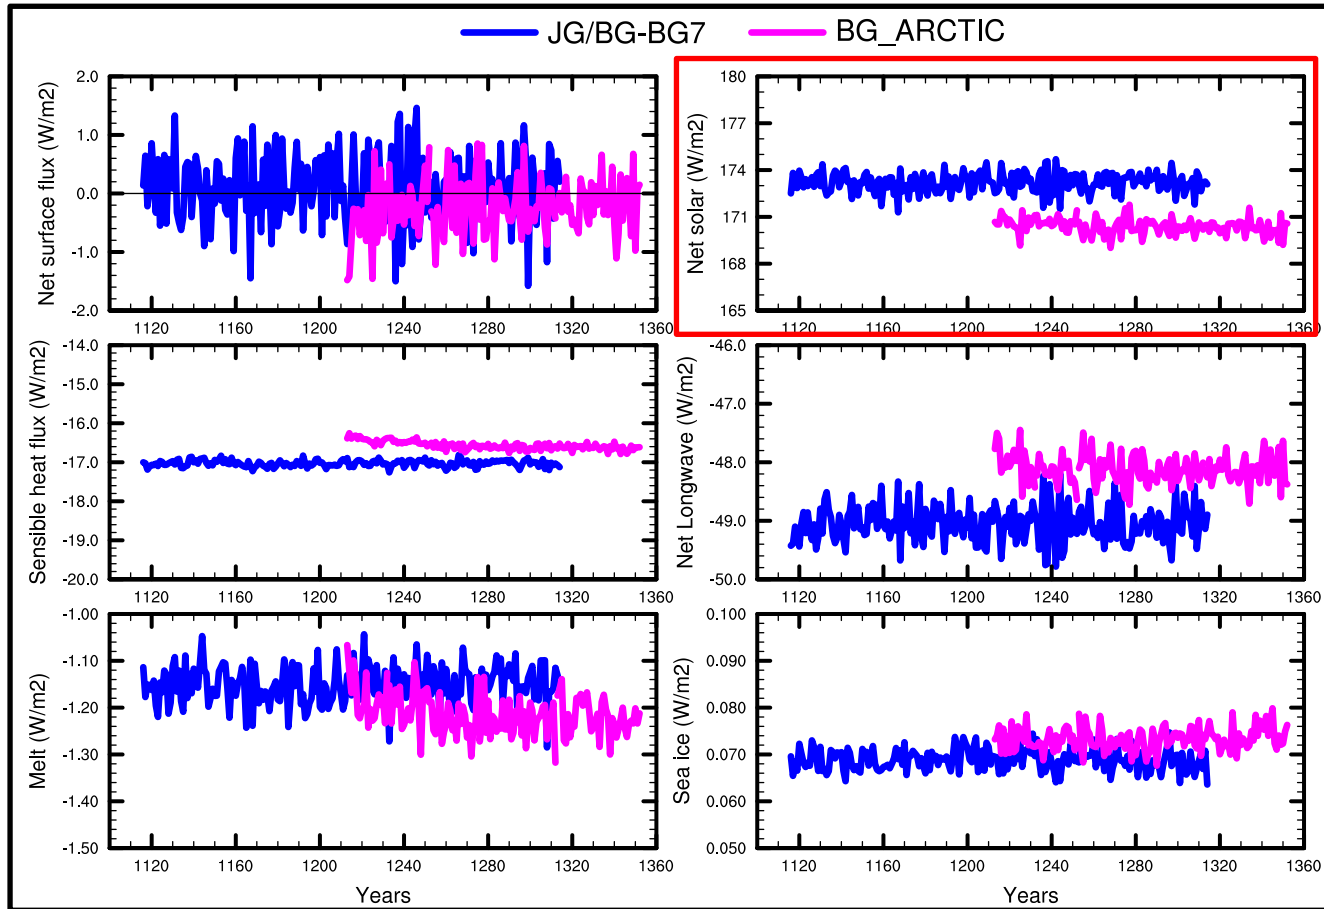

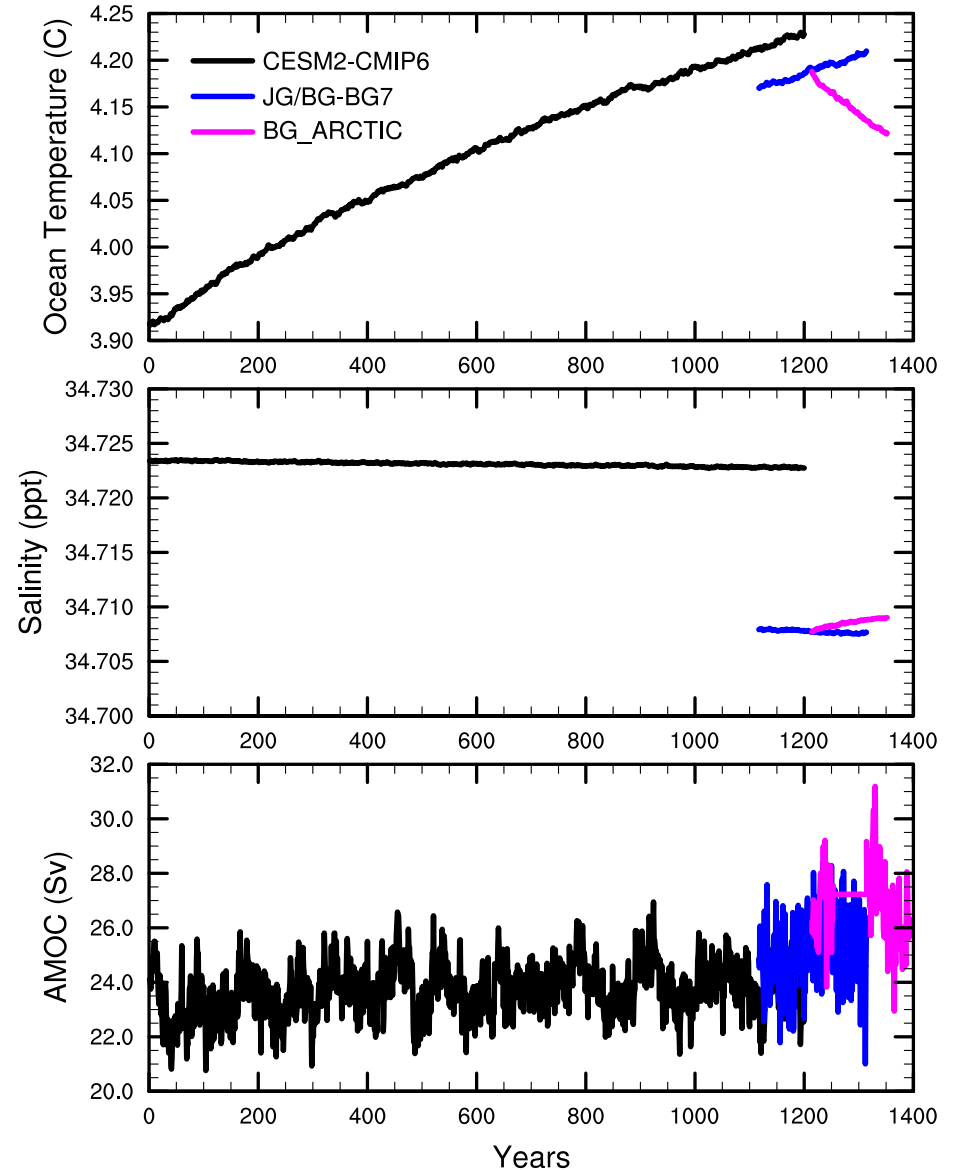

# Preindustrial Control

CISM is on; branch from **JG/BG control** (Lofverstrom et al. 2020)

Ocean heat flux budget

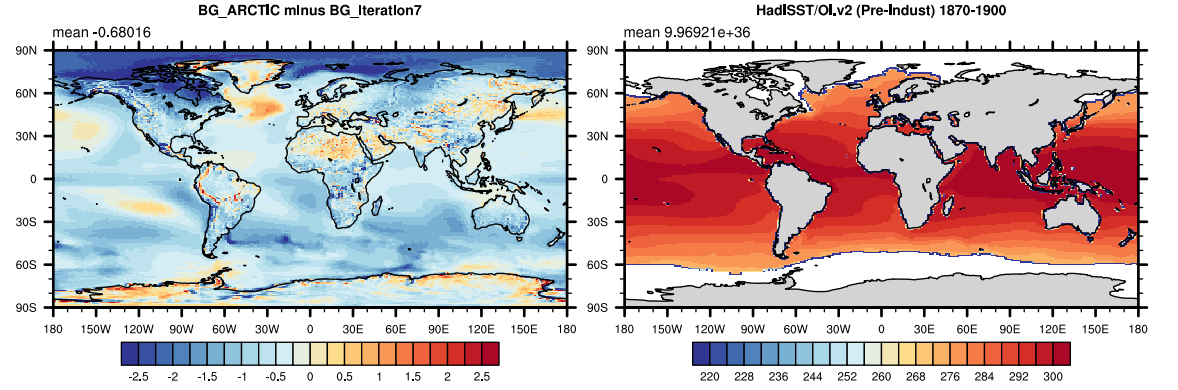

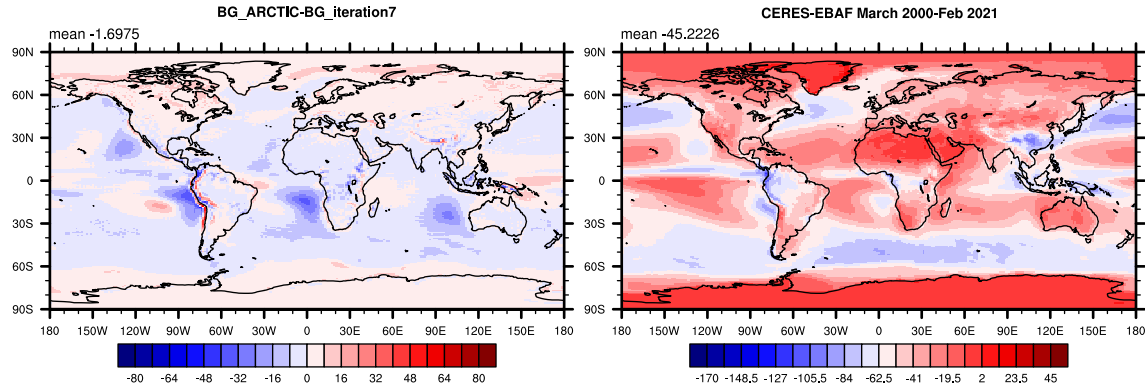

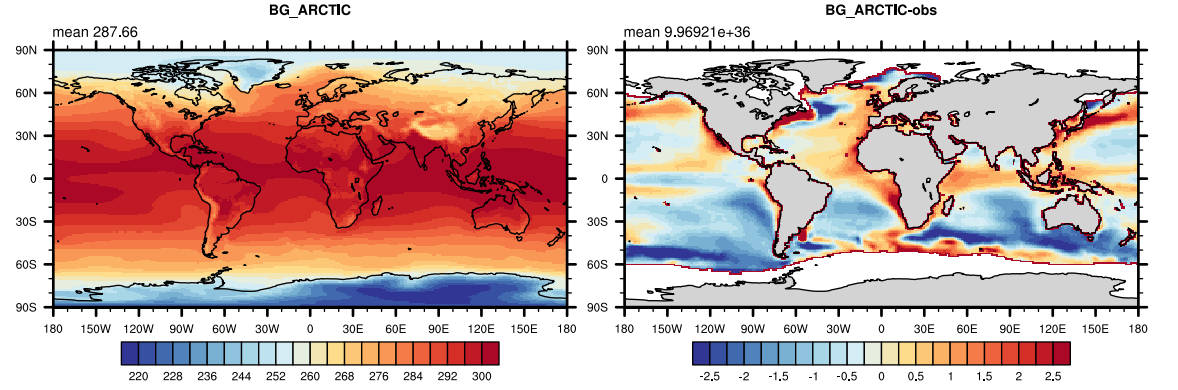

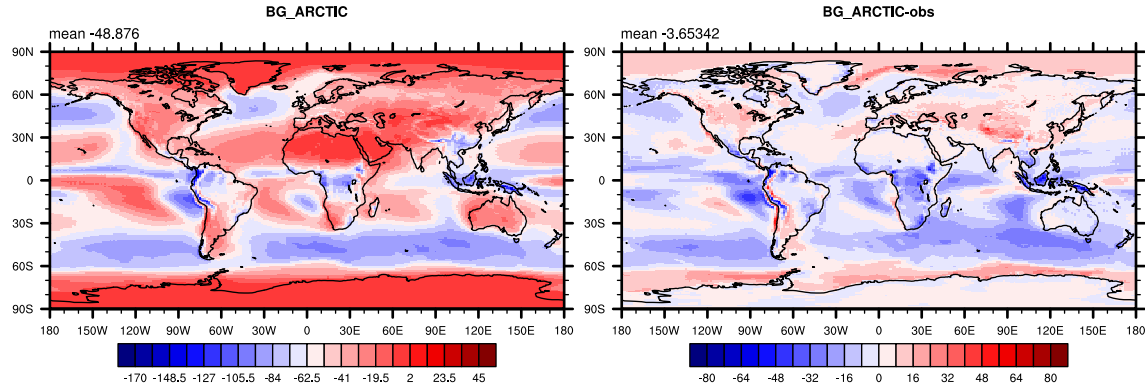

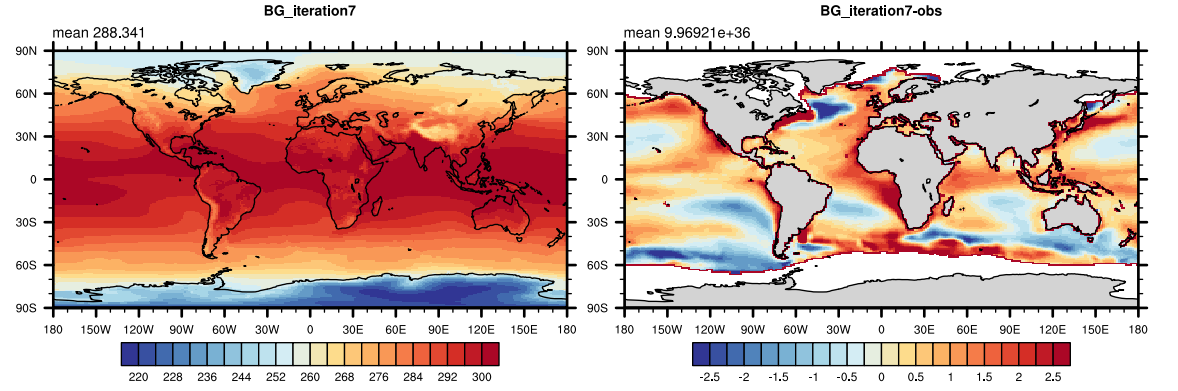

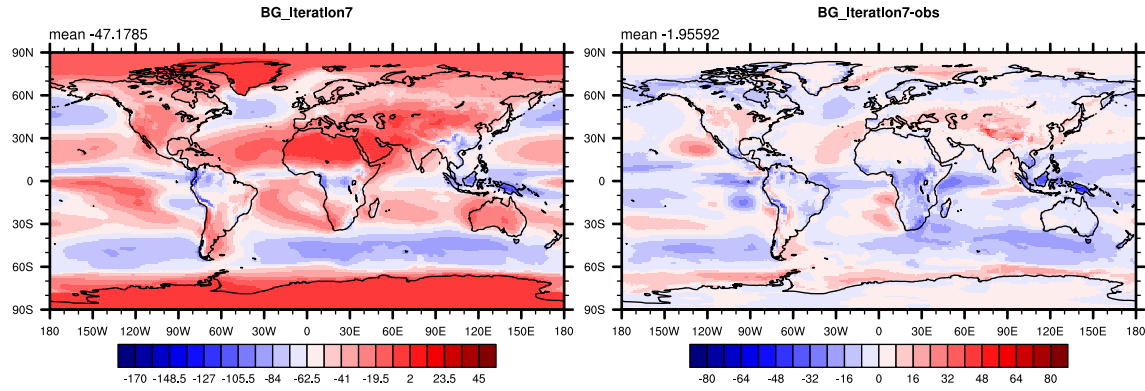

Overshot the cloud forcing; ~3 W/m<sup>2</sup> reduction in absorbed solar

# SWCF (W/m2)

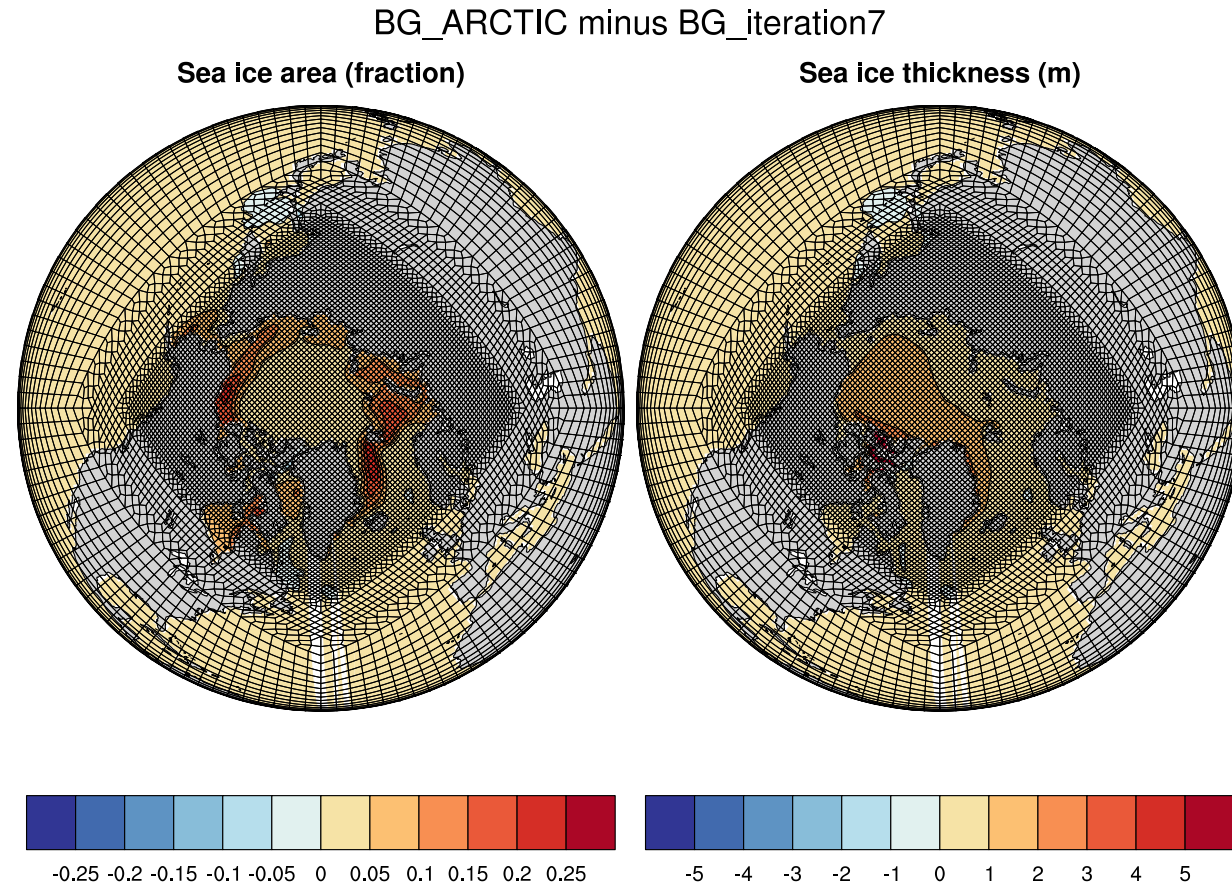

# SST (K)

# Preindustrial Control

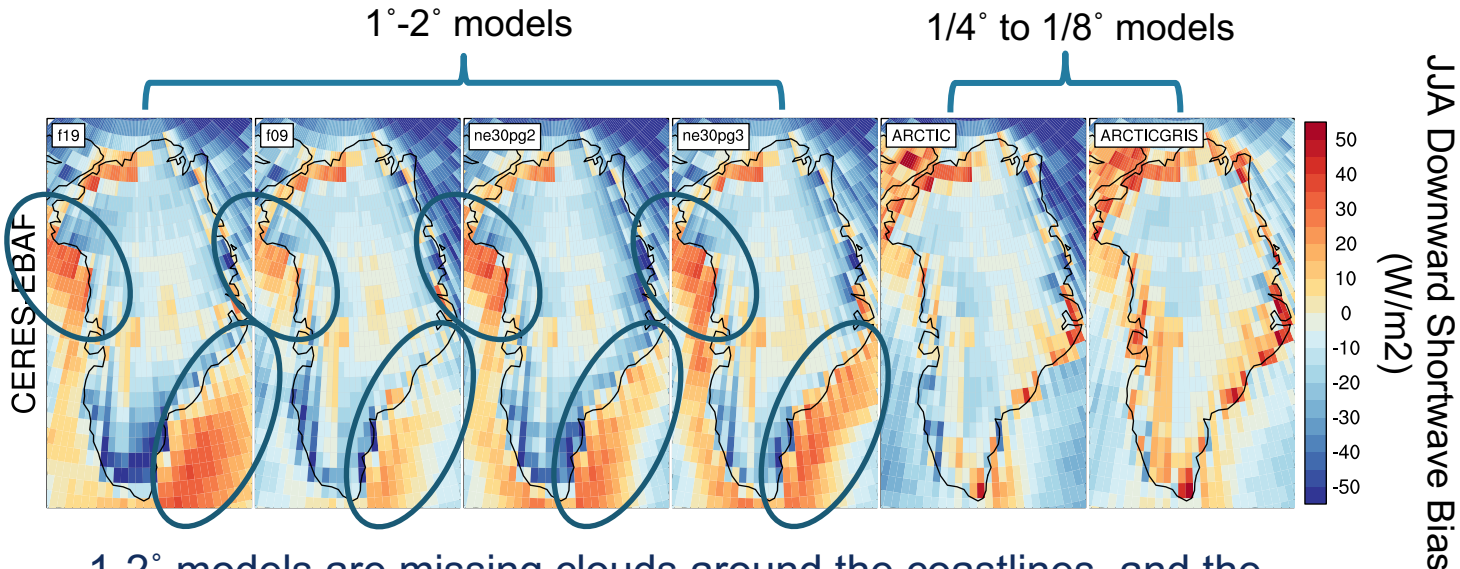

CISM is on; branch from **JG/BG control** (Lofverstrom et al. 2020)

\*80 year means

# Greenland clouds / precipitation sensitive to resolution
