Flavio Lehner (Cornell), Richard Seager (LDEO)*

Two reasons why we care about atmospheric water vapor...

# Two reasons why we care about atmospheric water vapor...

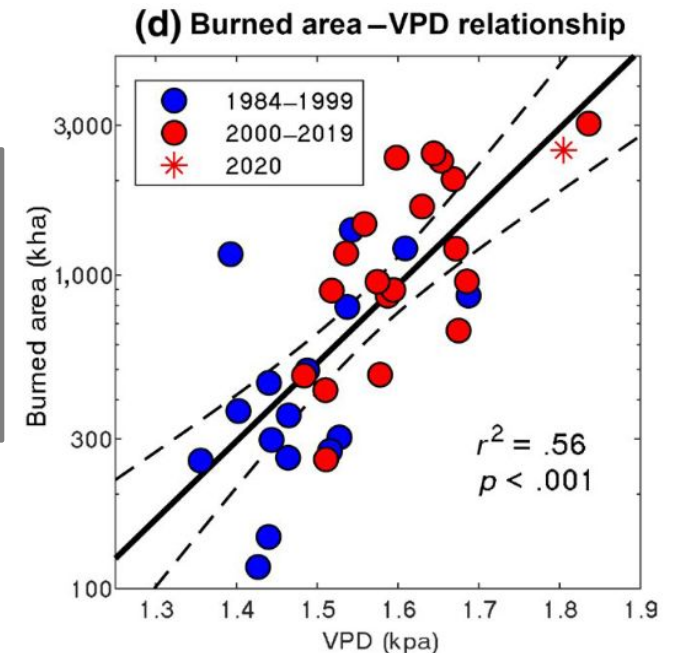

Close links between vapor pressure deficit and wildfire

$$VPD = e_s - e_a$$

Saturation Vapor Pressure  
(Depends on Temperature)

Actual Vapor Pressure

Higuera and Abatzoglou  
(2020) - over the US  
southwest, you have a  
larger burned area in a  
fire season when the  
VPD is high

# Two reasons why we care about atmospheric water vapor...

An indicator of trends in processes that (a) we don't necessarily have good observations of and (b) we may not have a perfect representation of in our Earth System Models

Close links between vapor pressure deficit and wildfire

$$VPD = e_s - e_a$$

Saturation Vapor Pressure  
(Depends on Temperature)

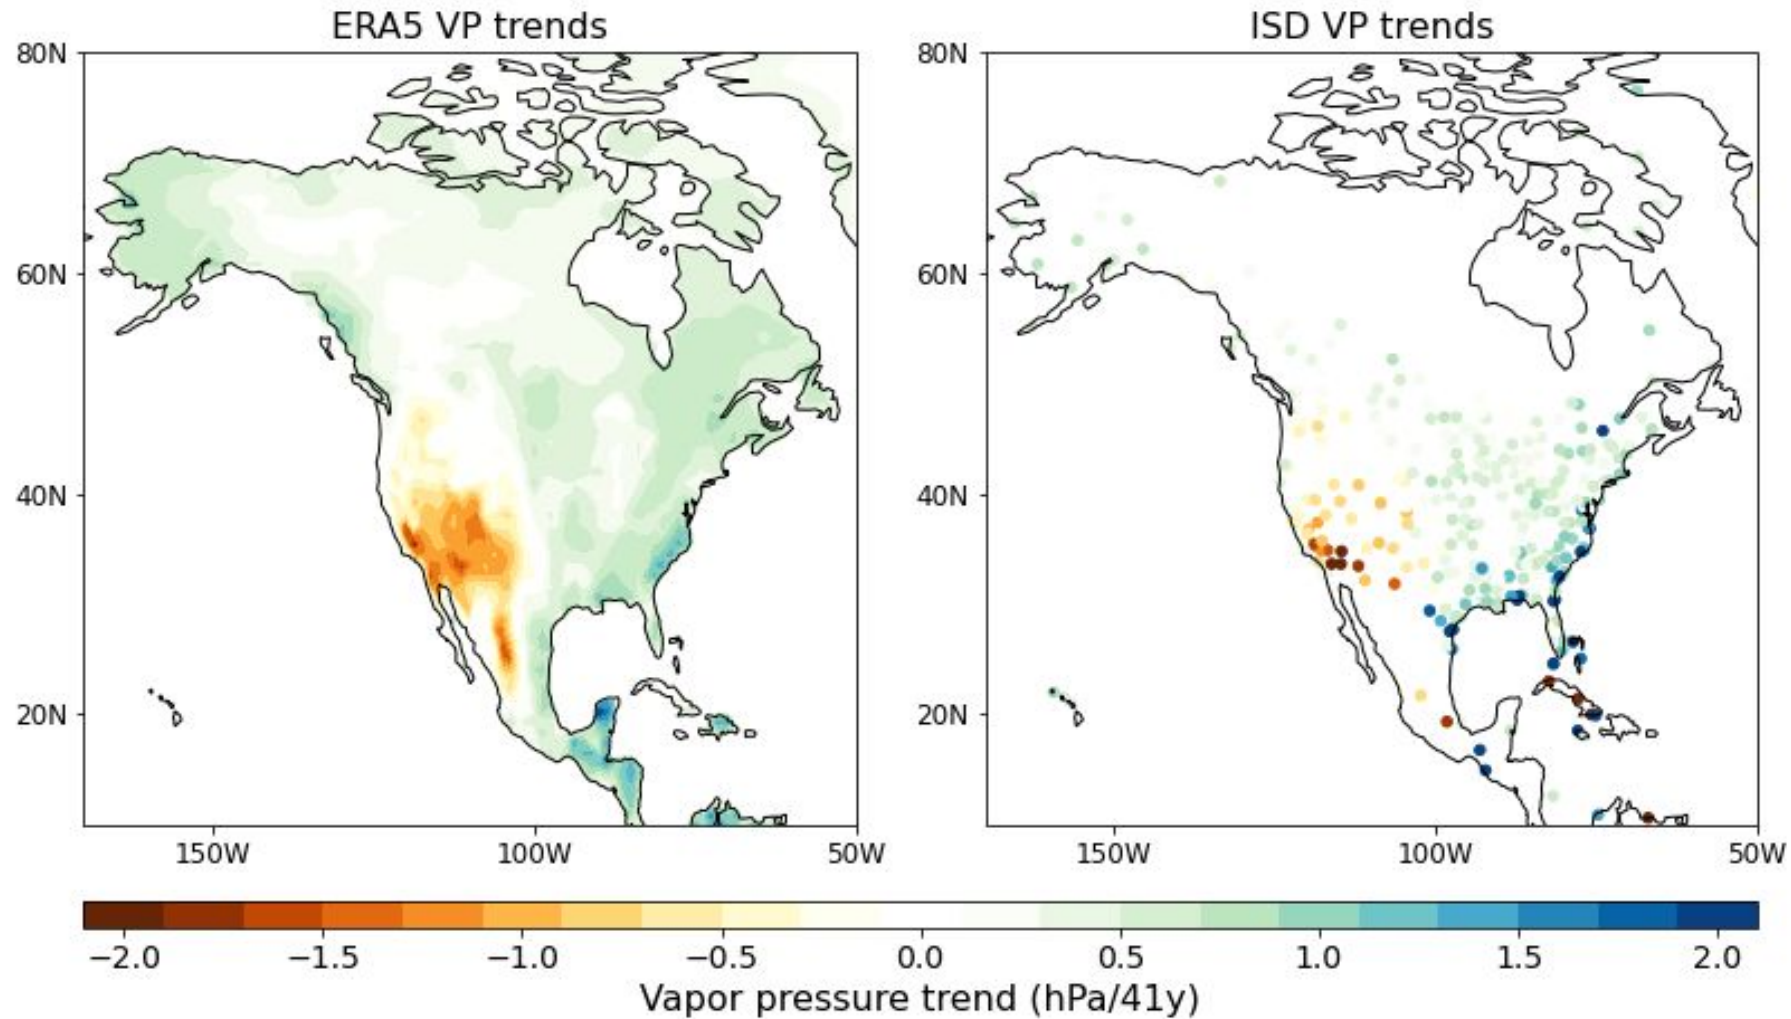

Actual Vapor Pressure

Higuera and Abatzoglou (2020) - over the US southwest, you have a larger burned area in a fire season when the VPD is high

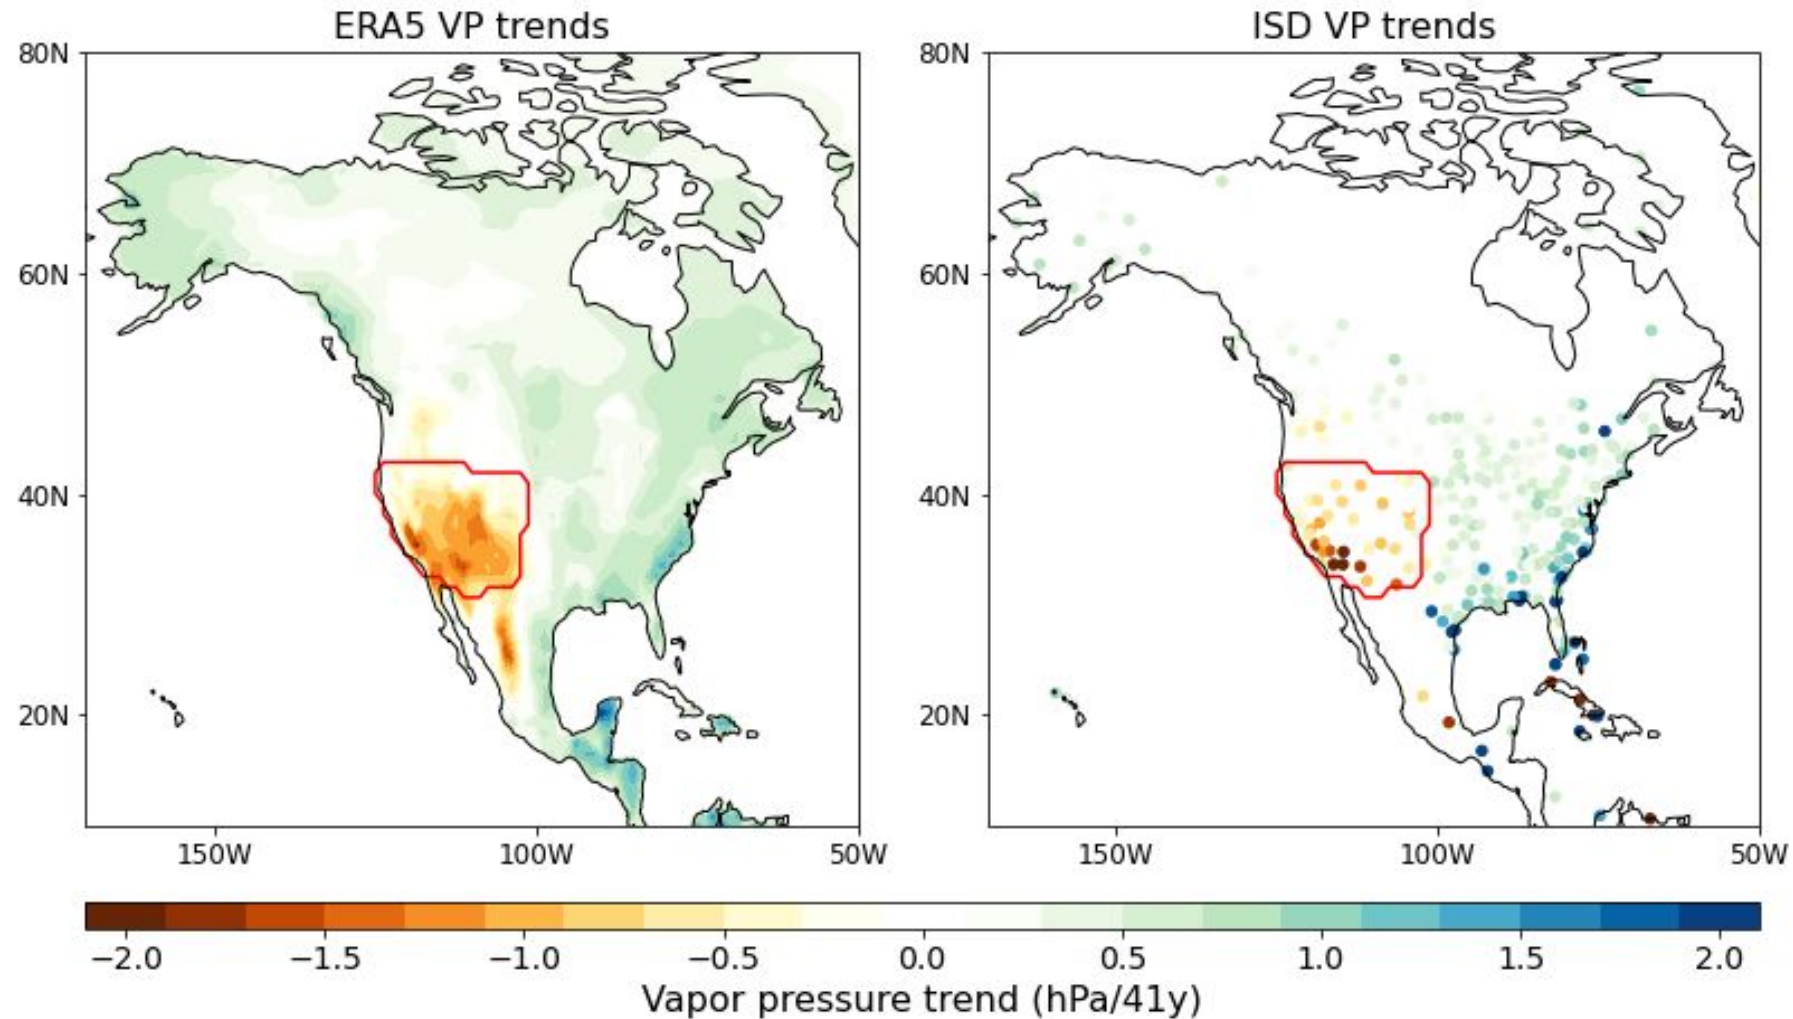

# A case study: the US Southwest

## Annual mean 2m vapor pressure trends, 1980-2020

# A case study: the US Southwest

# Vapor pressure trends averaged over the Southwest

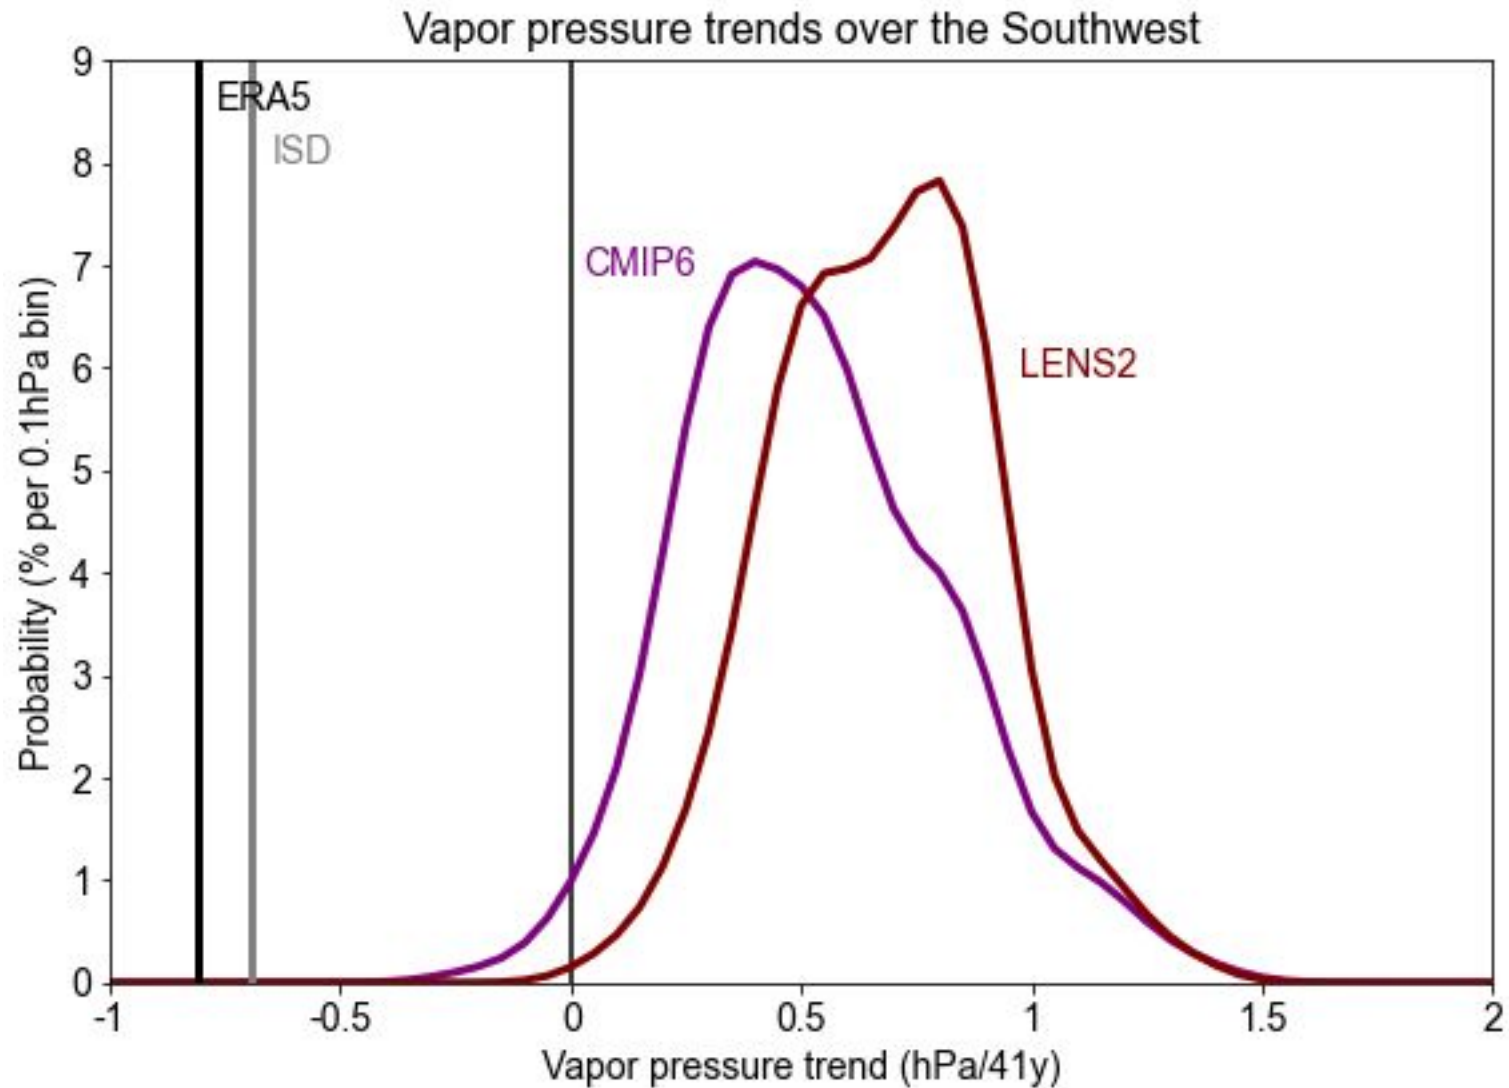

# Vapor pressure trends averaged over the Southwest

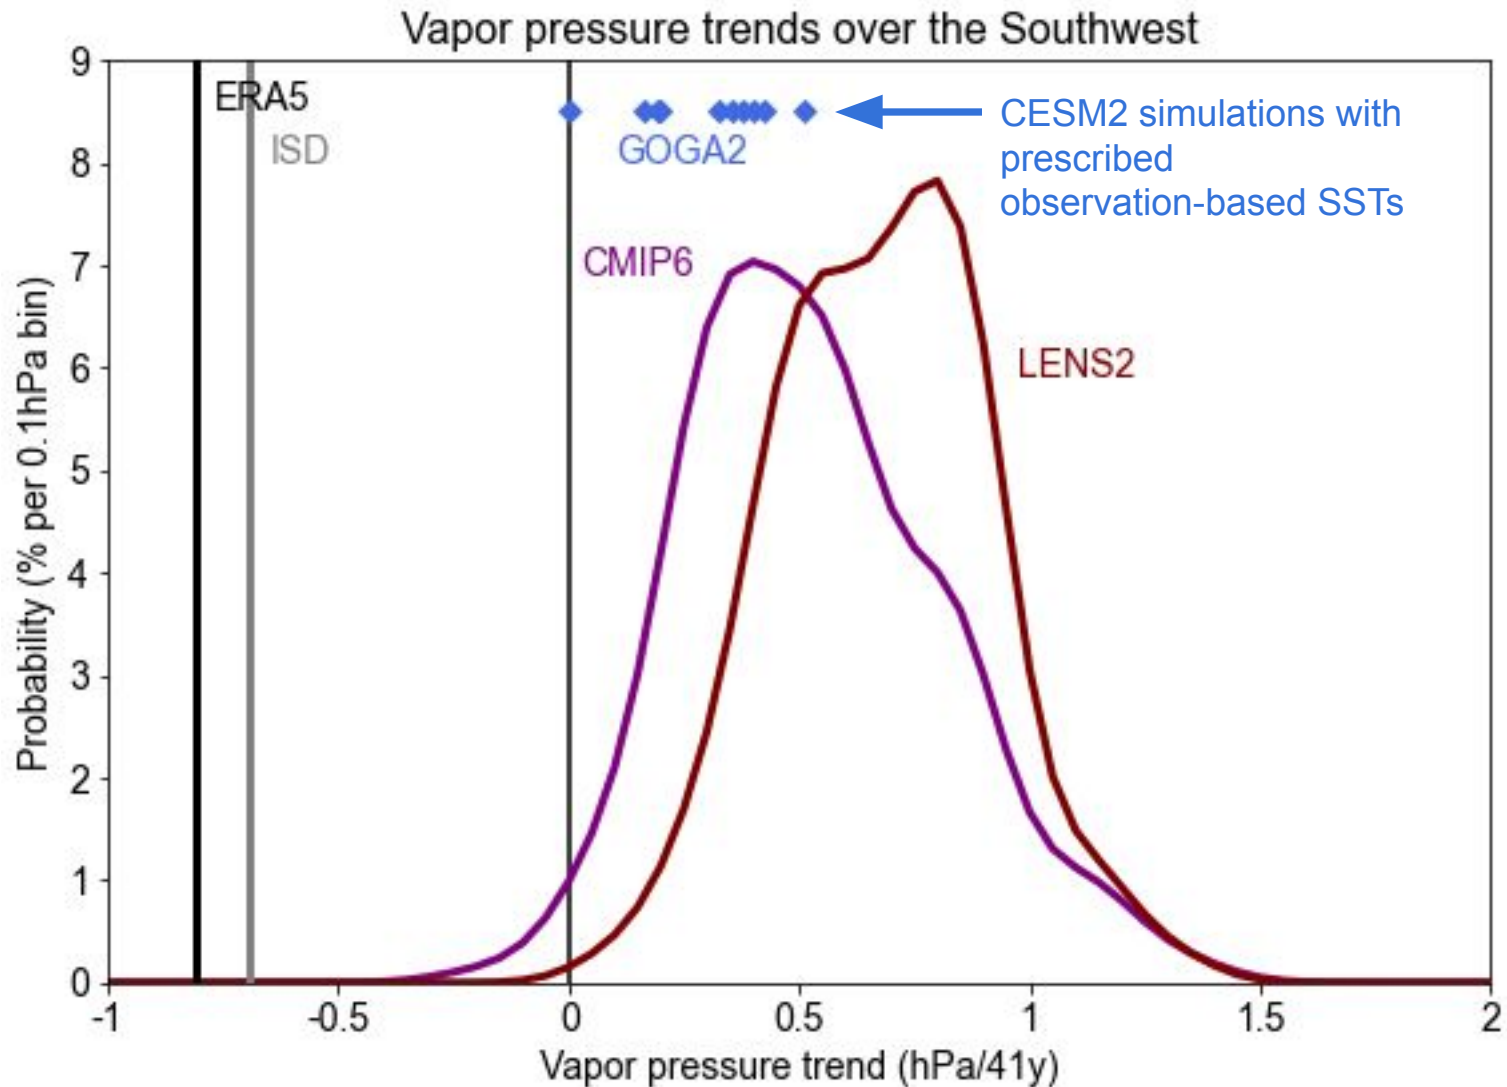

# Vapor pressure trends averaged over the Southwest

# Vapor pressure trends averaged over the Southwest

# Vapor pressure trends averaged over the Southwest

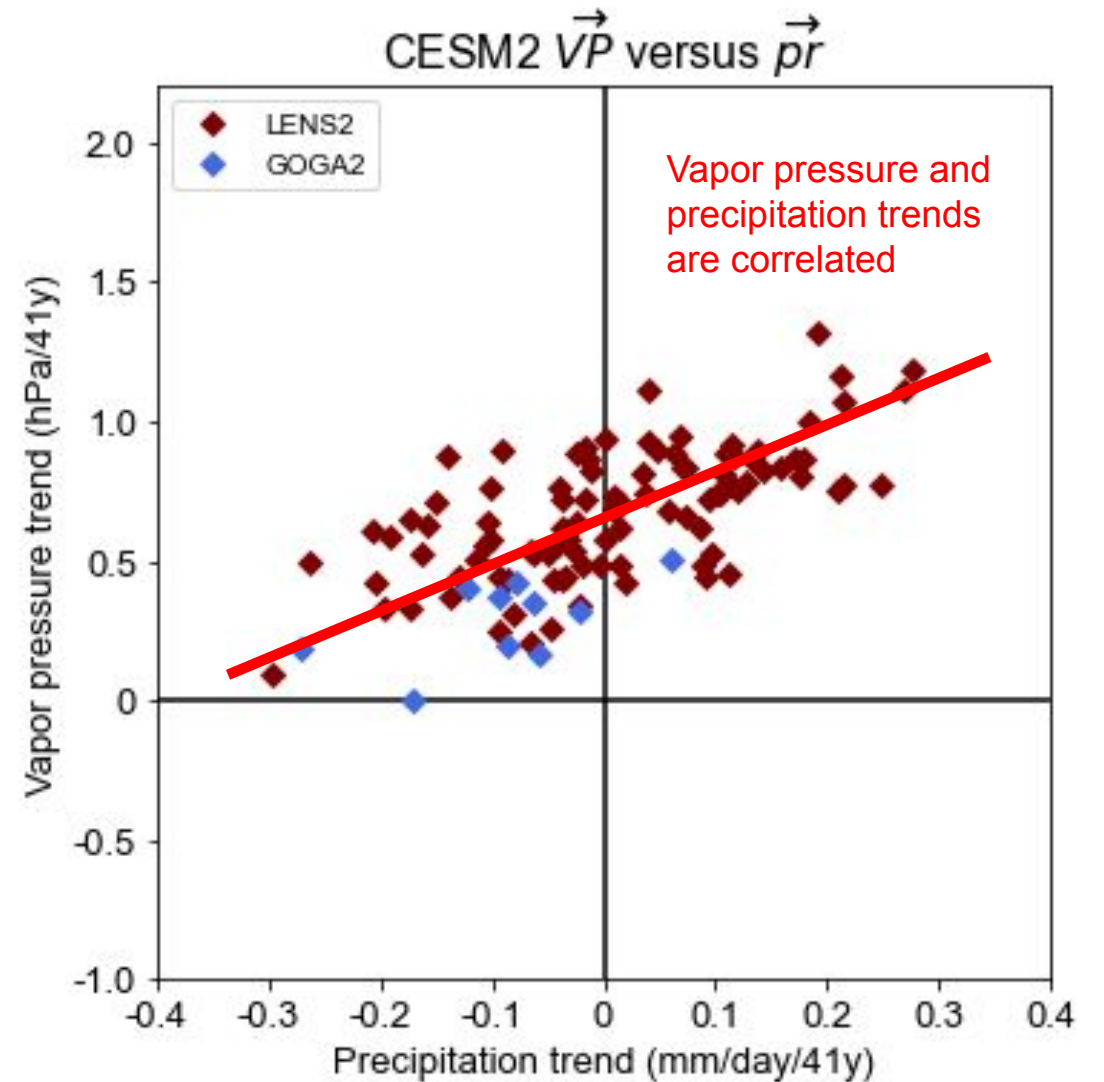

Our models come nowhere close to simulating the negative vapor pressure trend that we have observed

The US Southwest has experienced a precipitation decline since 1980 (Lehner et al 2018). Is this decline in vapor pressure in observations related to that precipitation change?

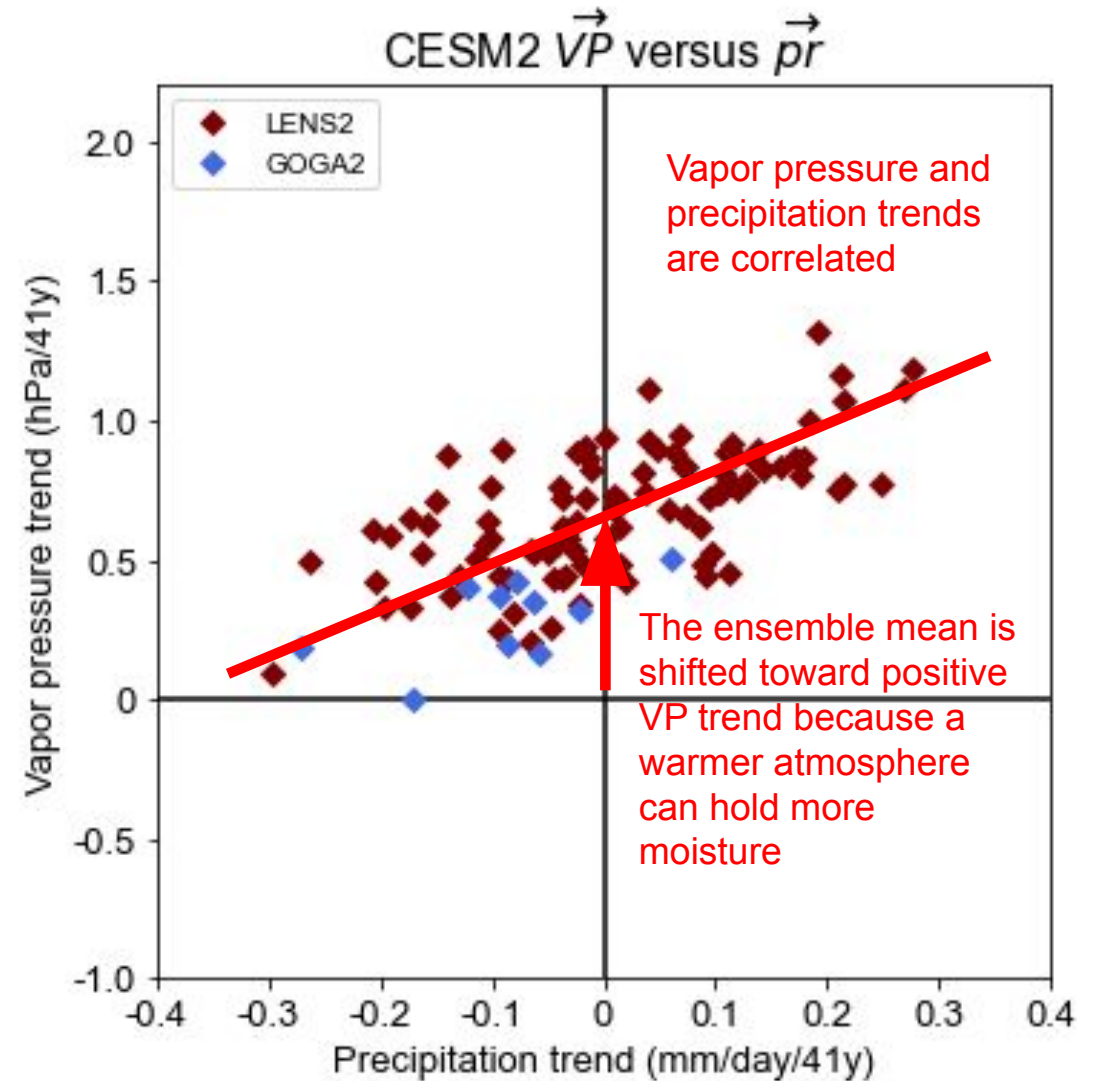

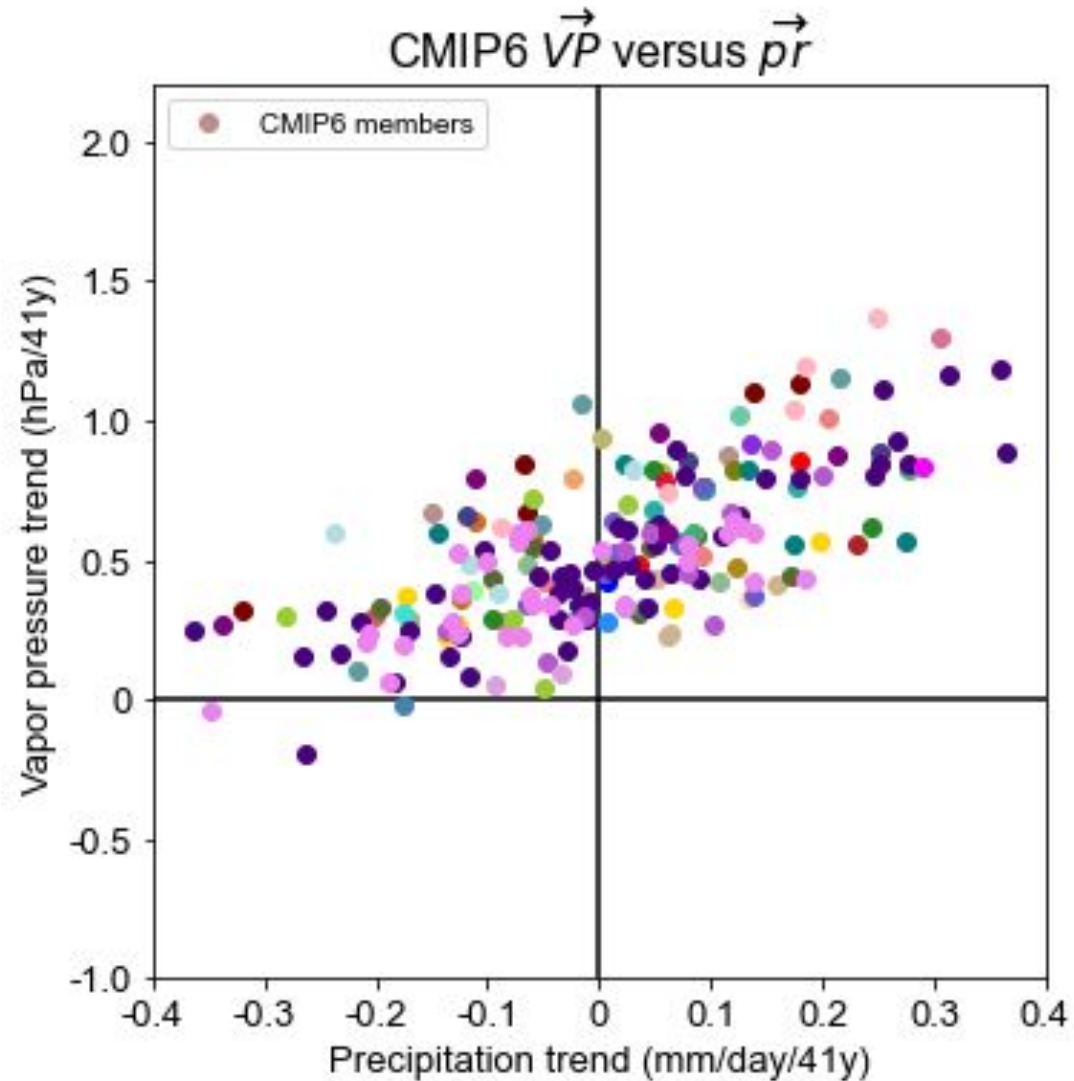

# Relationship between vapor pressure and precipitation trends in the US southwest

# Relationship between vapor pressure and precipitation trends in the US southwest

+/- 2 standard deviations of the residuals around the regression line

# Global vapor pressure trends

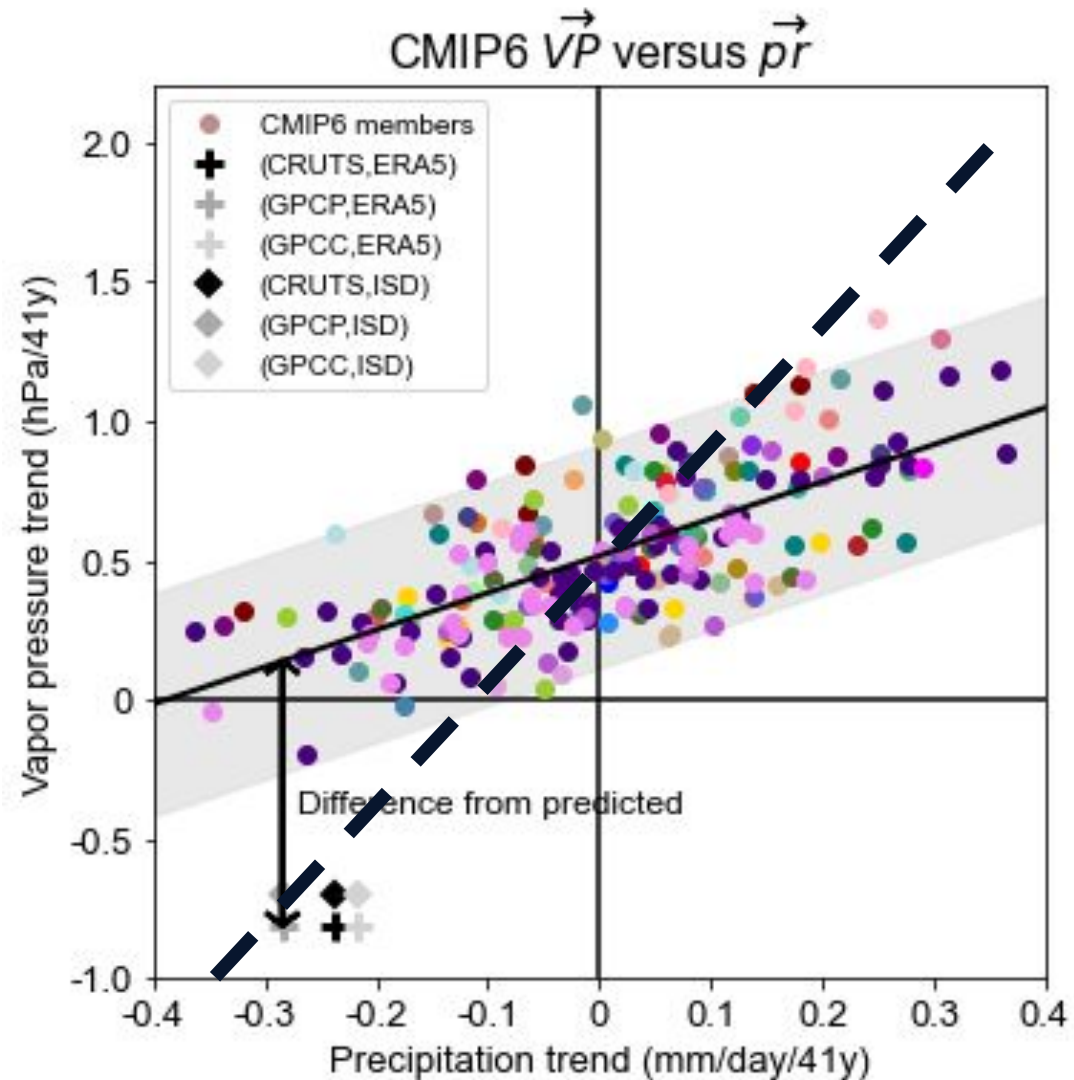

# Global vapor pressure trends

Three possibilities:

# Global vapor pressure trends

Three possibilities:

(1) The relationship between precip and vapor pressure is not represented correctly

# Global vapor pressure trends

Three possibilities:

- (1) The relationship between precip and vapor pressure is not represented correctly
- (2) The forced thermodynamic trend in vapor pressure is incorrect

# Global vapor pressure trends

Three possibilities:

- (1) The relationship between precip and vapor pressure is not represented correctly
- (2) The forced thermodynamic trend in vapor pressure is incorrect
- (3) Some additional missing variability

# Global vapor pressure trends

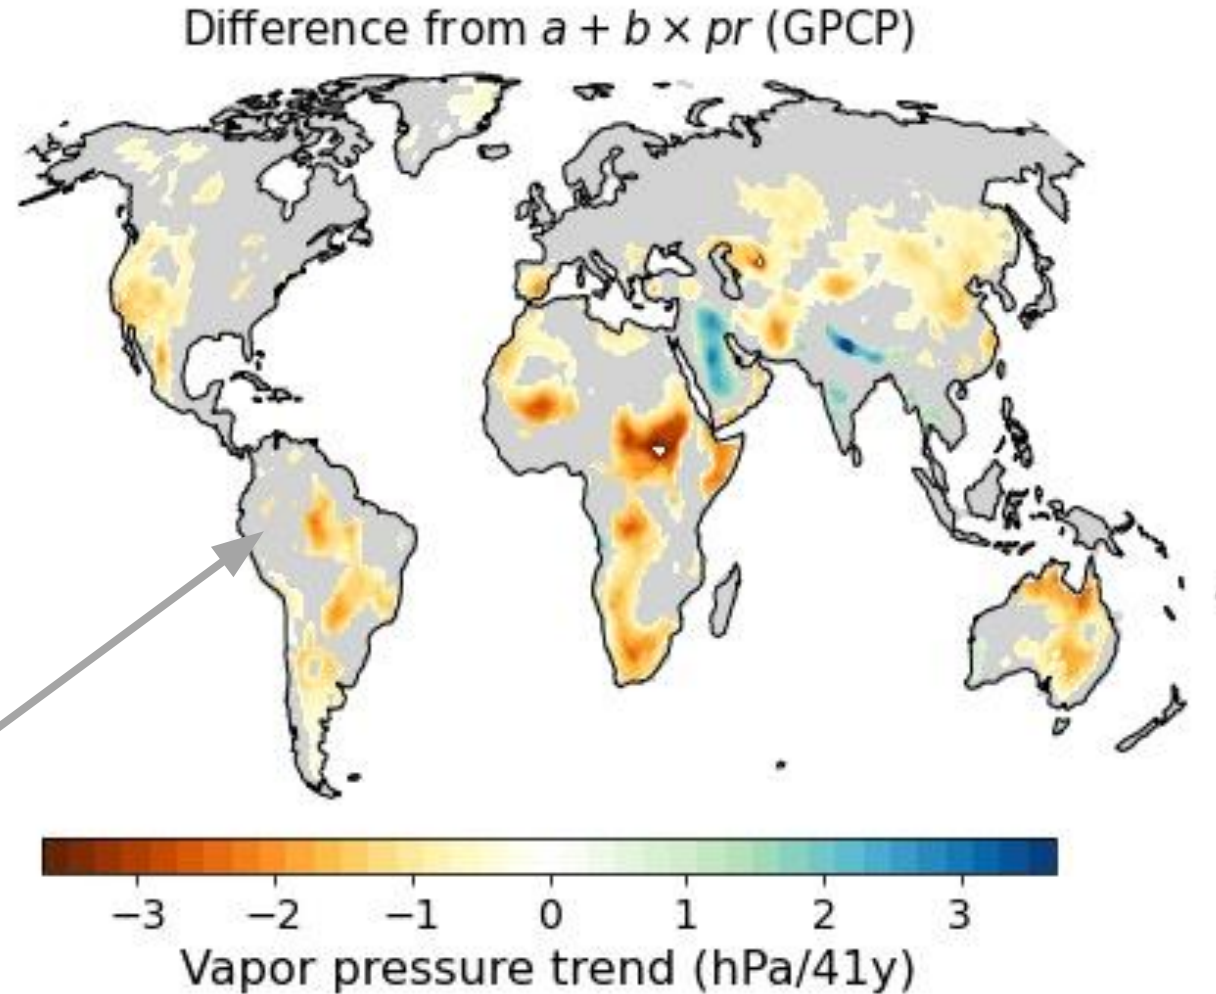

We'll go through this same procedure but at each 1 degree grid box and assess the difference from what would be predicted based on GPCC precipitation trends and the CMIP6 relationship between vapor pressure and precipitation trends.

# Global vapor pressure trends

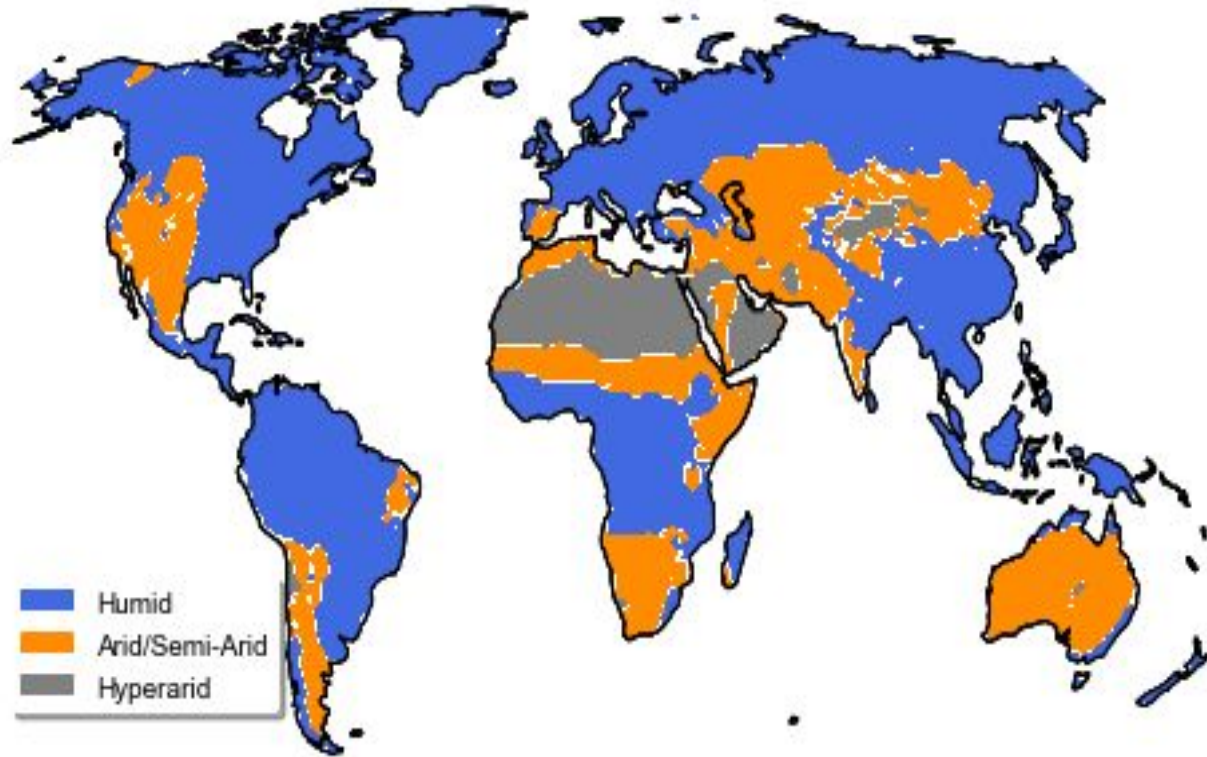

Gray = not outside of the +/- 2 standard deviation of the residuals range from the regression line based on CMIP6

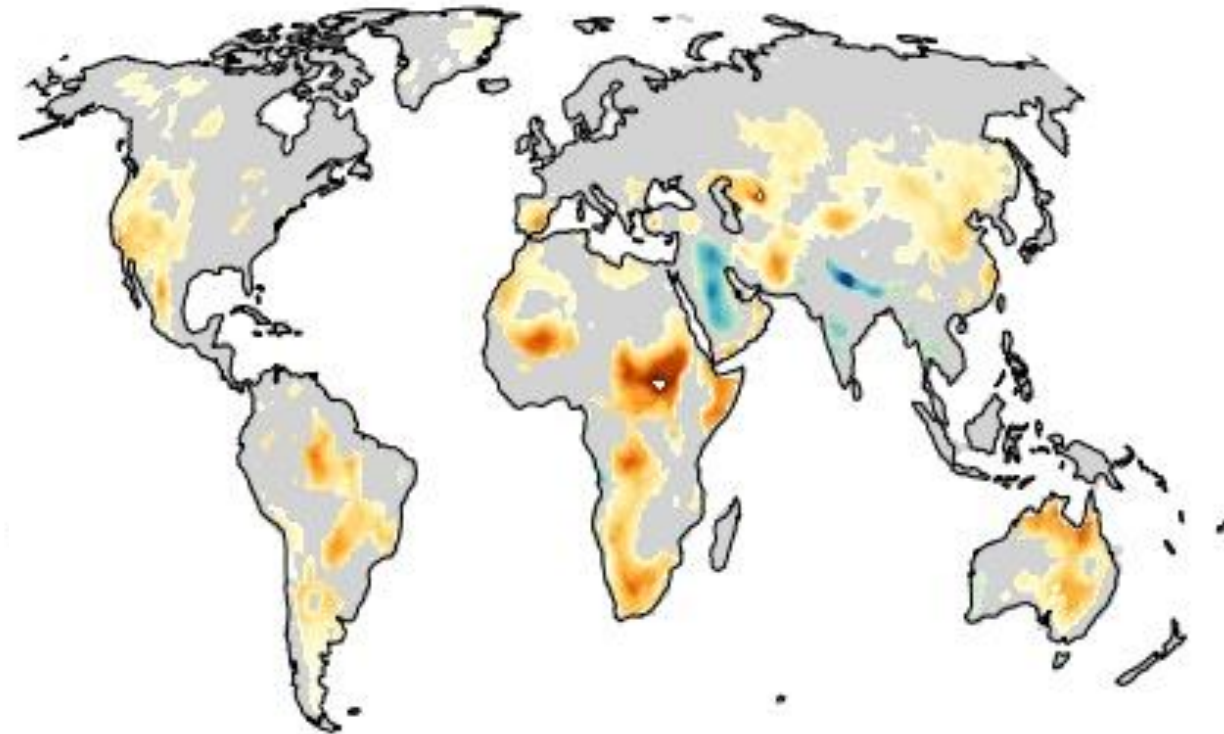

(ERA5 and ISD also agree well in other regions of the world)

# Global vapor pressure trends

Aridity Zones

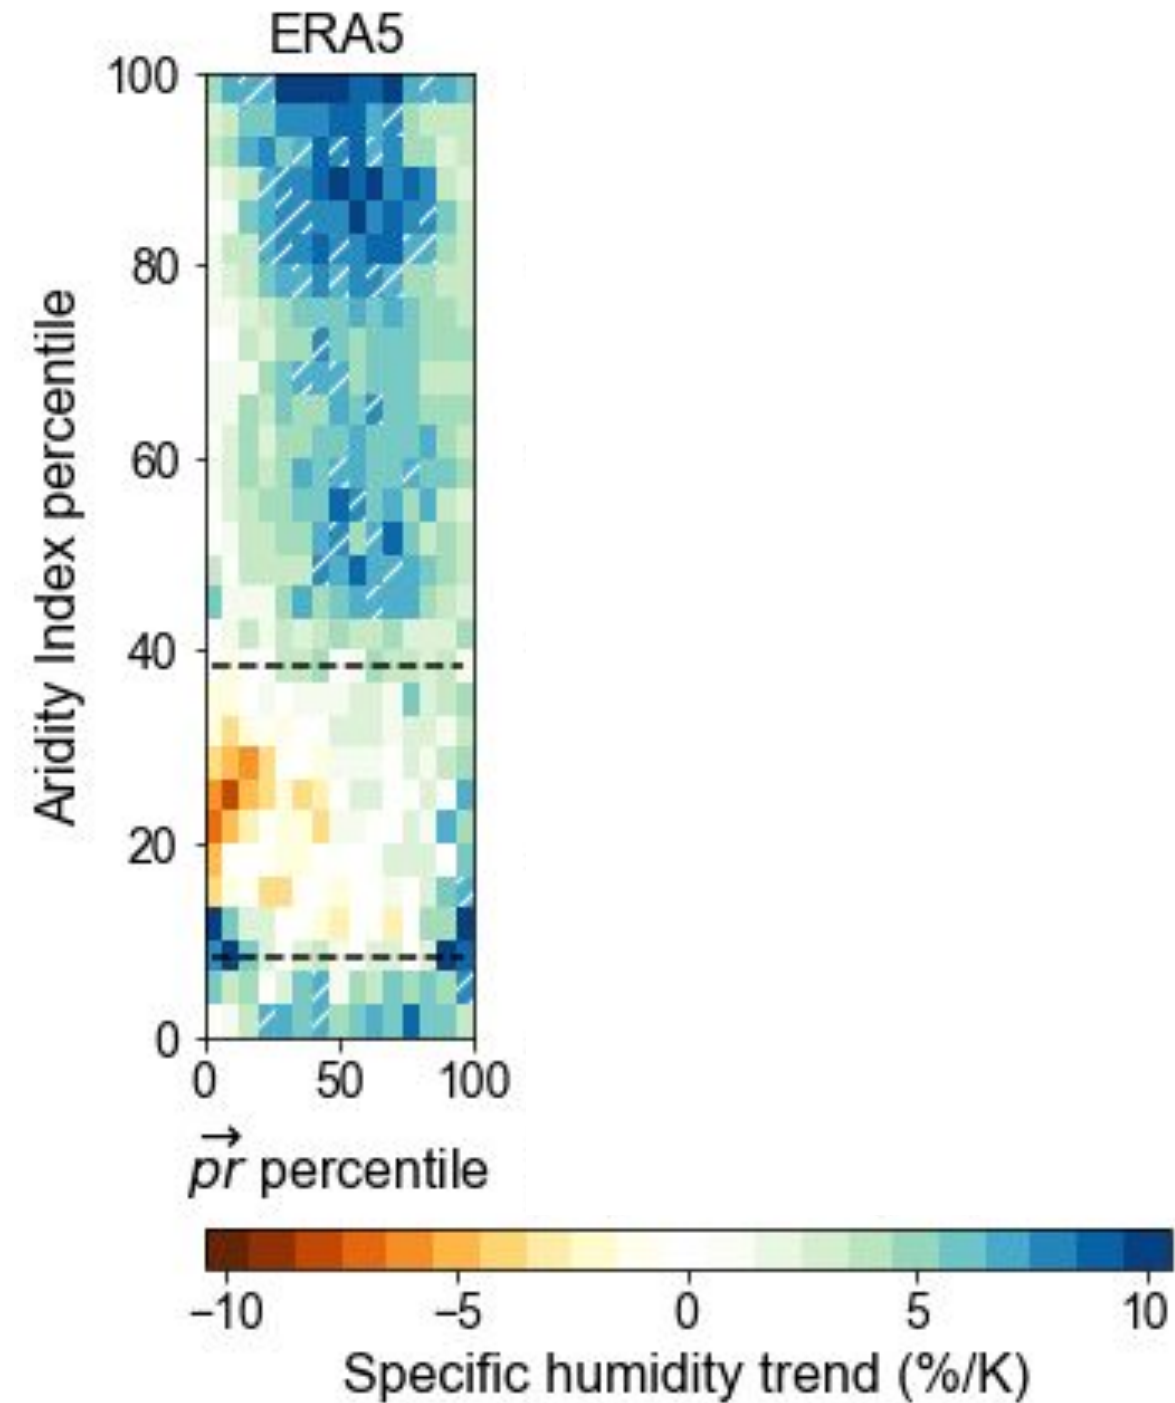

Difference from  $a + b \times pr$  (GPCP)

$$\text{Aridity Index} = \frac{P}{PET}$$

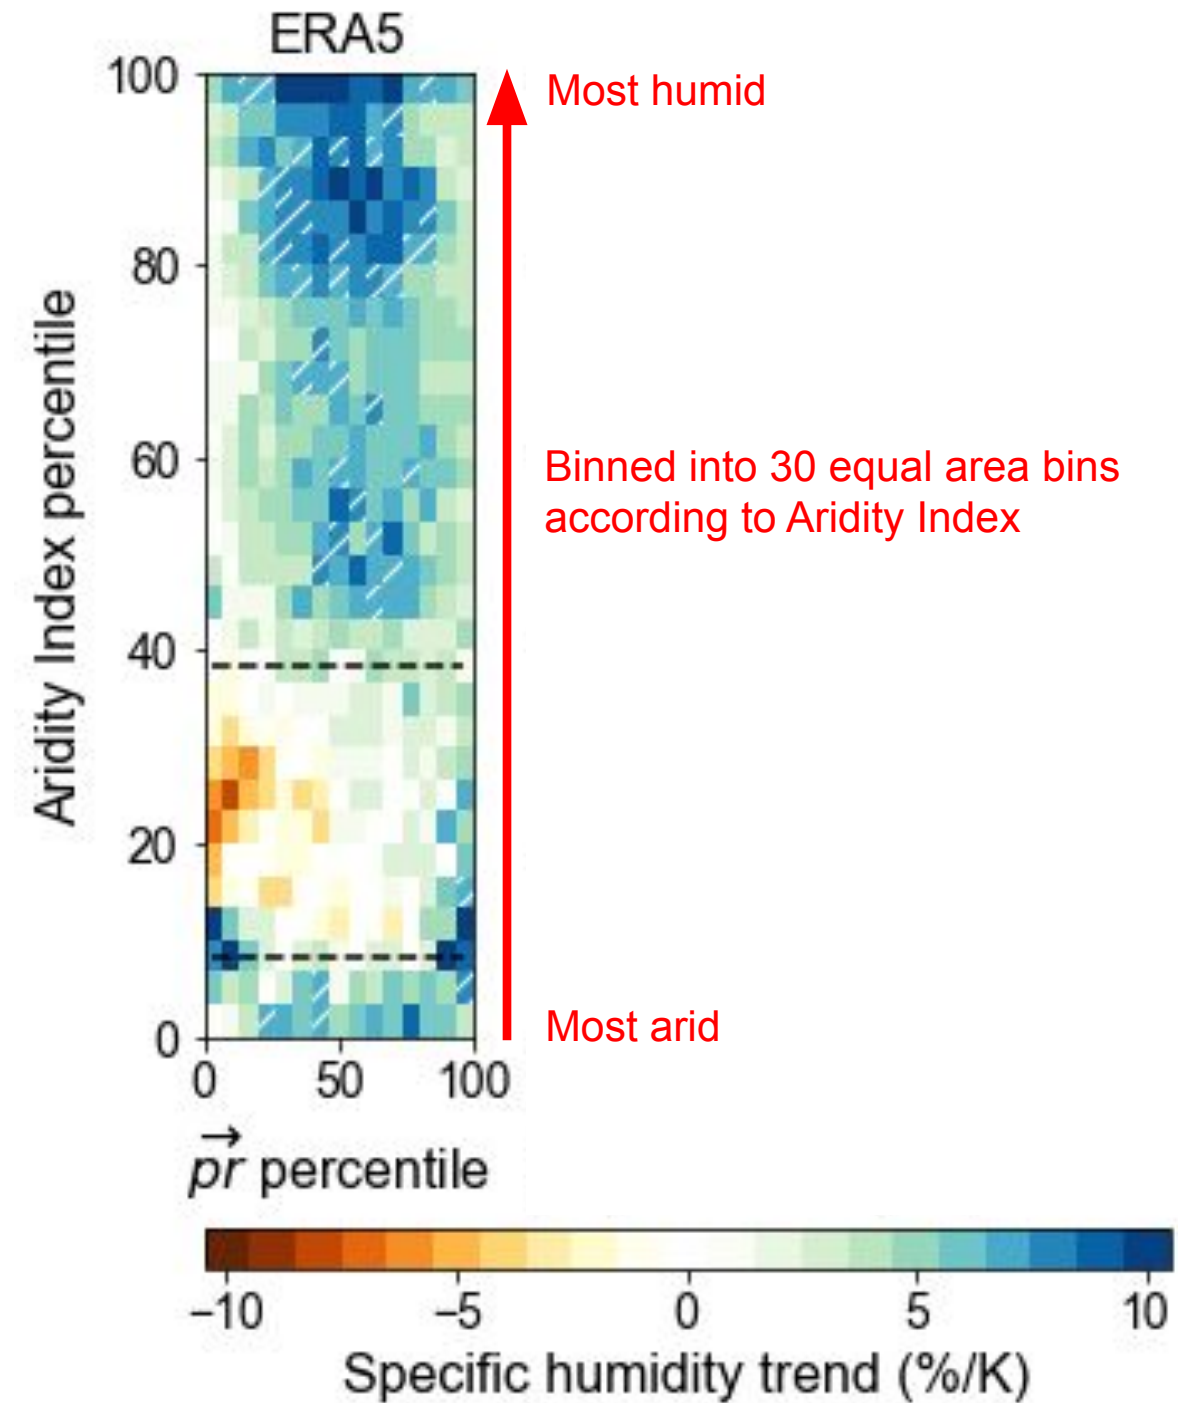

Precipitation

Potential Evapotranspiration

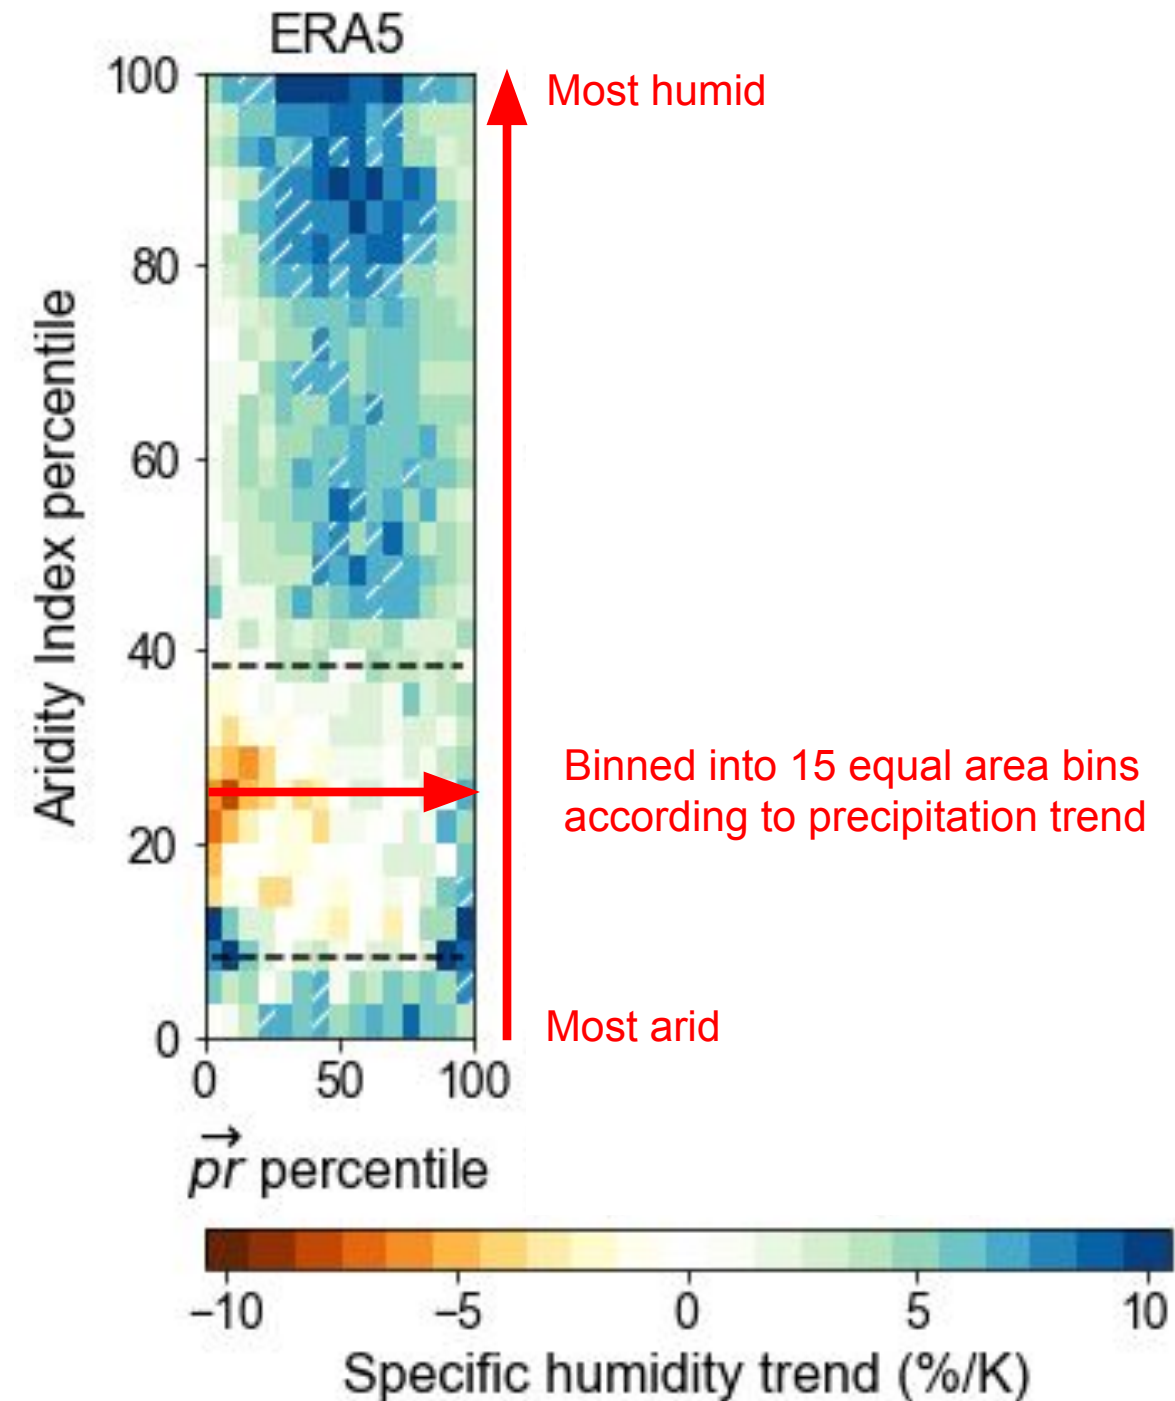

Specific humidity trends expressed as a percentage of the 1980-1990 climatology, normalized by land area average near surface air temperature change

Using ERA5 for observed VP and GPCP for observed precip

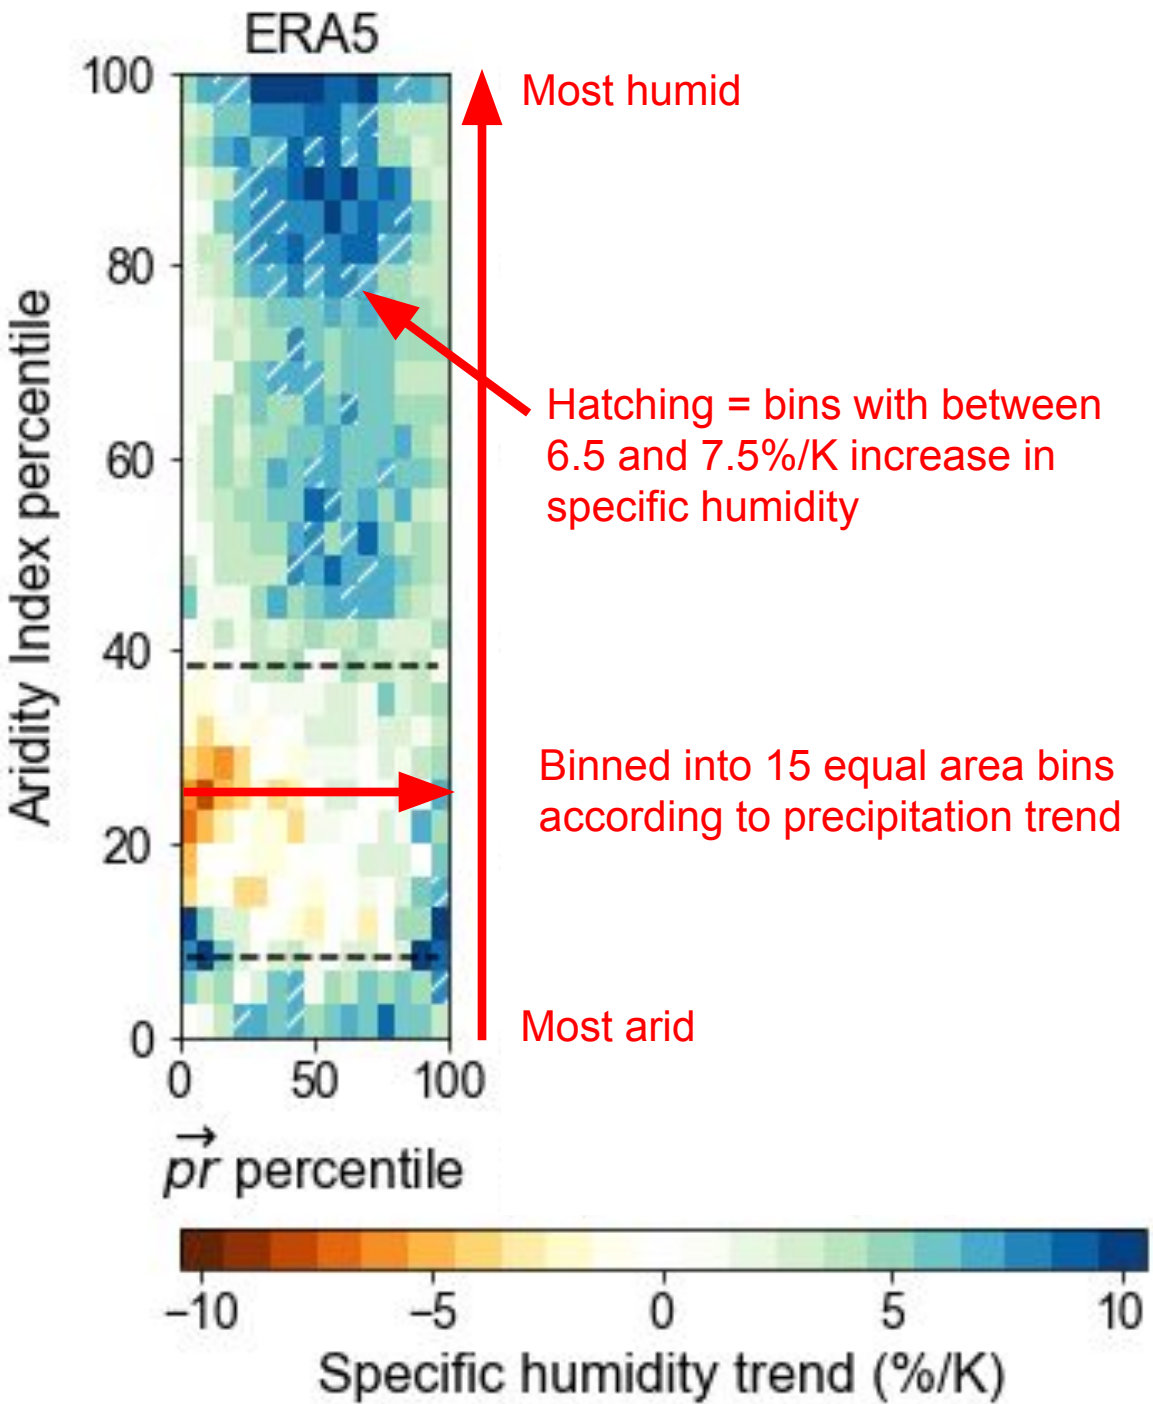

Specific humidity trends expressed as a percentage of the 1980-1990 climatology, normalized by land area average near surface air temperature change

Using ERA5 for observed VP and GPCP for observed precip

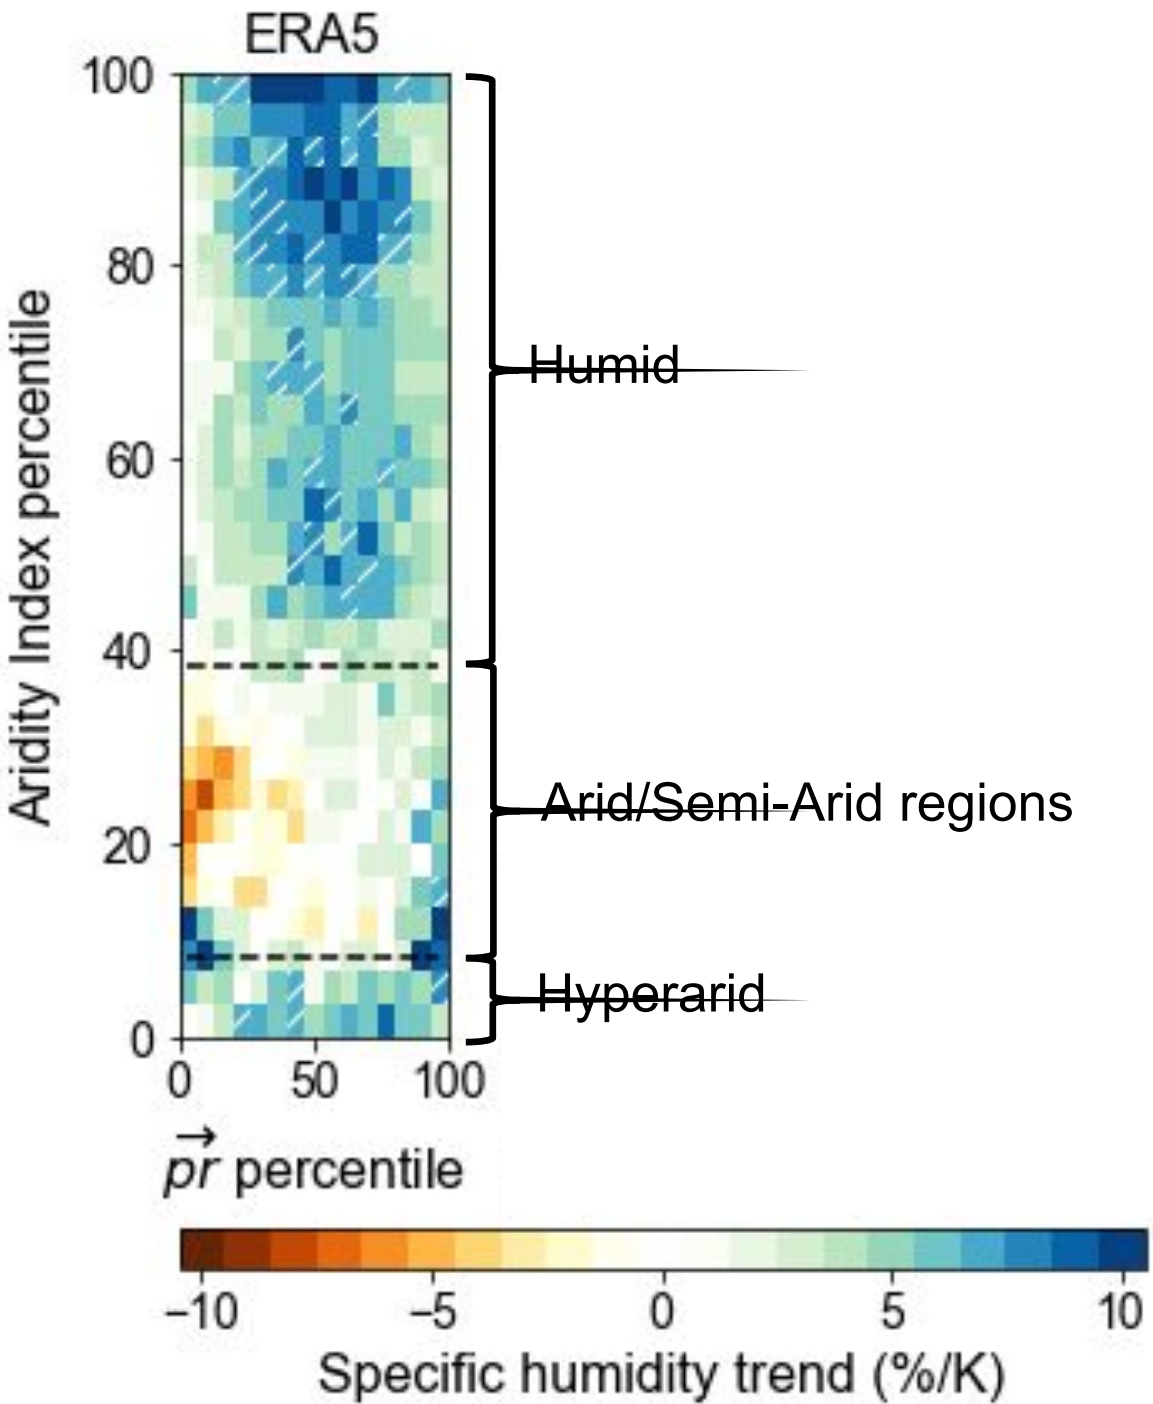

Specific humidity trends expressed as a percentage of the 1980-1990 climatology, normalized by land area average near surface air temperature change

Using ERA5 for observed VP and GPCP for observed precip

Specific humidity trends expressed as a percentage of the 1980-1990 climatology, normalized by land area average near surface air temperature change

Using ERA5 for observed VP and GPCC for observed precip

Specific humidity trends expressed as a percentage of the 1980-1990 climatology, normalized by land area average near surface air temperature change

Using ERA5 for observed VP and GPCC for observed precip

CMIP6 follows Clausius Clapeyron scaling regardless of the climatological Aridity ( $\sim 7\%/K$  with near zero precipitation trend).

Specific humidity trends expressed as a percentage of the 1980-1990 climatology, normalized by land area average near surface air temperature change

Using ERA5 for observed VP and GPCP for observed precip

Stippling = ERA5 lies within the CMIP6 ensemble spread

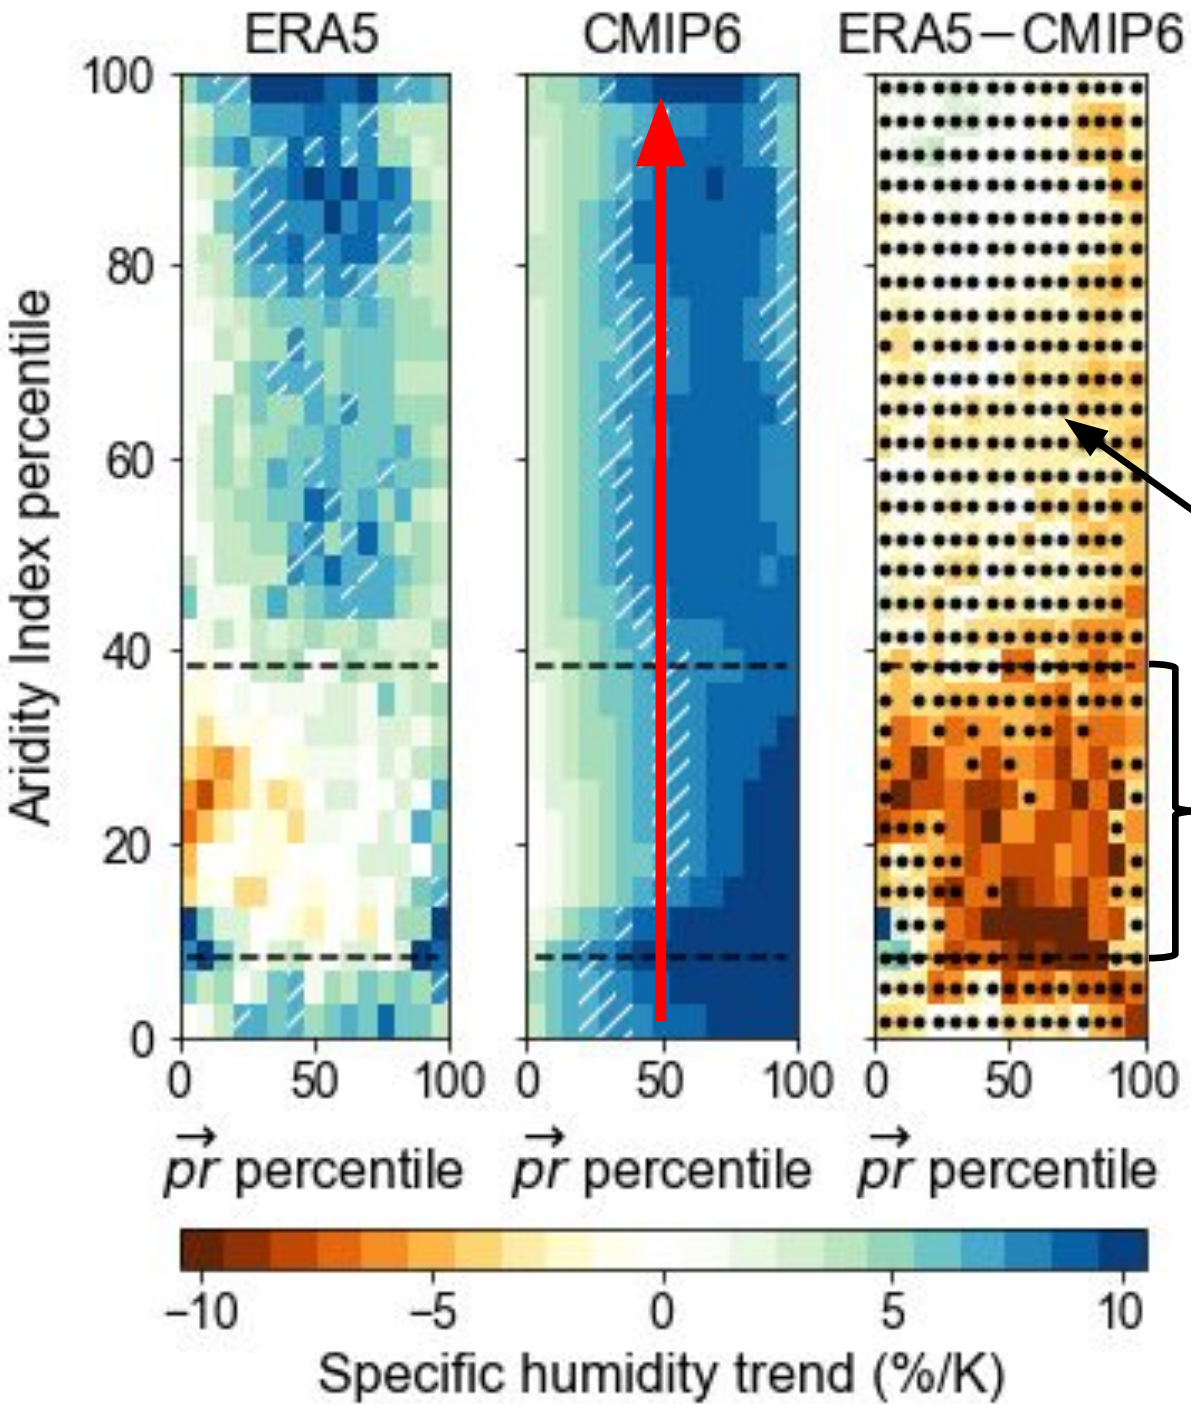

Specific humidity trends expressed as a percentage of the 1980-1990 climatology, normalized by land area average near surface air temperature change

Using ERA5 for observed VP and GPCC for observed precip

Stippling = ERA5 lies within the CMIP6 ensemble spread

ERA5 shows reduced specific humidity trends compared to CMIP6 in arid/semi-arid regions.

Specific humidity trends expressed as a percentage of the 1980-1990 climatology, normalized by land area average near surface air temperature change

Using ERA5 for observed VP and GPCC for observed precip

Stippling = ERA5 lies within the CMIP6 ensemble spread

ERA5 shows reduced specific humidity trends compared to CMIP6 in arid/semi-arid regions.

Now we'll just focus on arid and semi-arid grid points

# Specific humidity trend (%/K) in arid/semi-arid regions versus precipitation trends

Joint pdf of specific humidity trends (expressed as a percentage of the 1980-1990 average, normalized by land area average temperature change) versus precipitation trends.

ERA5 for specific humidity and GPCP for precipitation

CMIP6

# Specific humidity trend (%/K) in arid/semi-arid regions versus precipitation trends

Joint pdf of specific humidity trends (expressed as a percentage of the 1980-1990 average, normalized by land area average temperature change) versus precipitation trends.

ERA5 for specific humidity and GPCP for precipitation

CMIP6

Average over precipitation bins of width 0.05 mm/day/41y

# Specific humidity trend (%/K) in arid/semi-arid regions versus precipitation trends

Joint pdf of specific humidity trends (expressed as a percentage of the 1980-1990 average, normalized by land area average temperature change) versus precipitation trends.

ERA5 for specific humidity and GPCC for precipitation

CMIP6

Average over precipitation bins of width 0.05 mm/day/41y

# Specific humidity trend (%/K) in arid/semi-arid regions versus precipitation trends

Joint pdf of specific humidity trends (expressed as a percentage of the 1980-1990 average, normalized by land area average temperature change) versus precipitation trends.

ERA5 for specific humidity and GPCC for precipitation

Observation-based specific humidity trends are lower at all precipitation trends

# Specific humidity trend (%/K) in arid/semi-arid regions versus precipitation trends

VP trends in the Southwest for individual members

Observation-based specific humidity trends are lower at all precipitation trends

# Specific humidity trend (%/K) in arid/semi-arid regions versus precipitation trends

The forced trend in vapor pressure, independent of precipitation, is different in the models

In observations, we don't see the forced, thermodynamic increase in vapor pressure over Arid/Semi-Arid regions that the models suggest should have happened

# Specific humidity trend (%/K) in arid/semi-arid regions versus precipitation trends

The forced trend in vapor pressure, independent of precipitation, is different in the models

In observations, we don't see the forced, thermodynamic increase in vapor pressure over Arid/Semi-Arid regions that the models suggest should have happened

Something is wrong, which could have potentially severe implications for climate projections in Arid/Semi-Arid regions

# Specific humidity trend (%/K) in arid/semi-arid regions versus precipitation trends

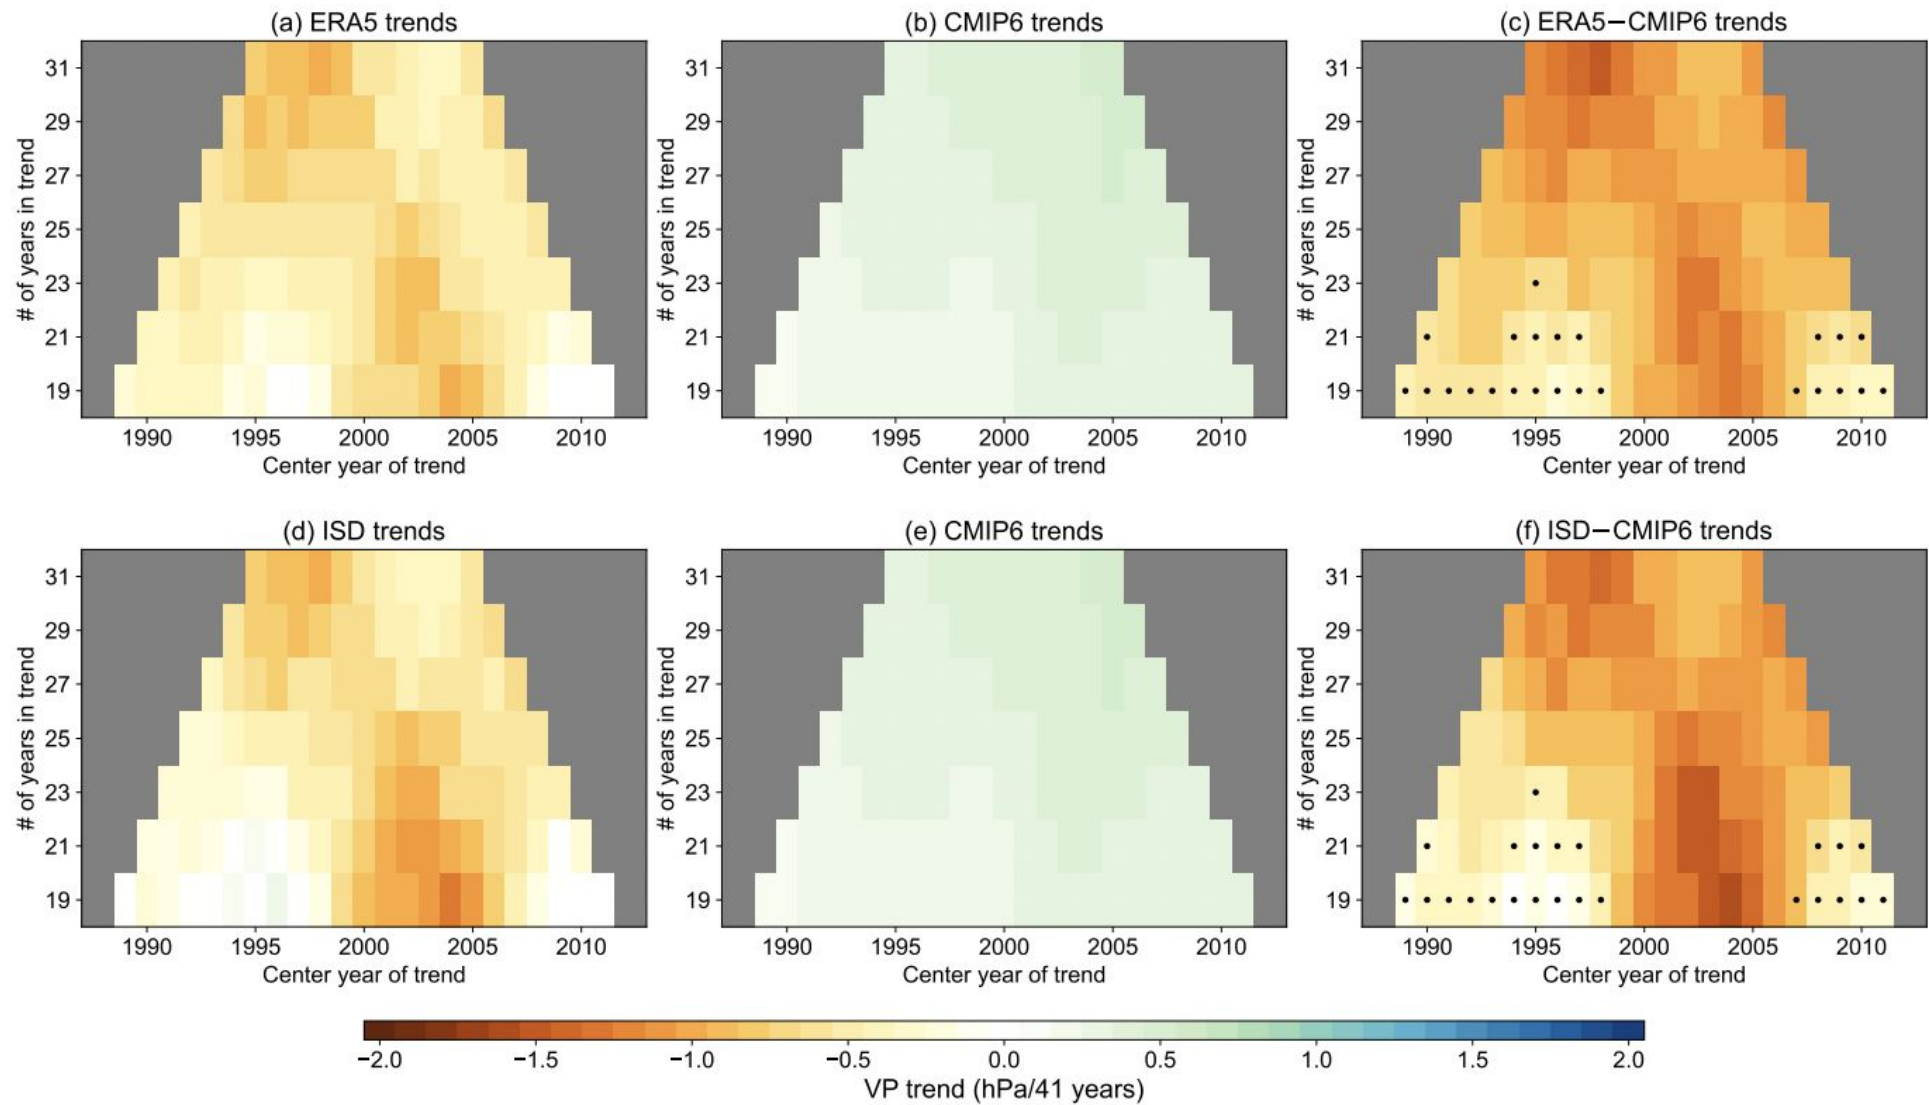

The forced trend in vapor pressure, independent of precipitation, is different in the models

In observations, we don't see the forced, thermodynamic increase in vapor pressure over Arid/Semi-Arid regions that the models suggest should have happened

Something is wrong, which could have potentially severe implications for climate projections in Arid/Semi-Arid regions

Too much water availability from the land surface?  
Has the land surface dried out more in reality?  
Plant physiology changes?  
A global water vapor transport issue?

Difference from  $a + b \times pr$  (GPCP)

# A challenge...

We don't really have observations of all the other relevant quantities that are needed  
While ERA5 produces vapor pressure trends that are consistent with station observations, it has other inconsistencies.

Soil moisture declines more in ERA5 than in the models

# A challenge...

We don't really have observations of all the other relevant quantities that are needed  
While ERA5 produces vapor pressure trends that are consistent with station observations, it has other inconsistencies.

Soil moisture declines more in ERA5 than in the models

So does evaporation

# A challenge...

We don't really have observations of all the other relevant quantities that are needed

While ERA5 produces vapor pressure trends that are consistent with station observations, it has other inconsistencies.

# A challenge...

We don't really have observations of all the other relevant quantities that are needed

GLEAM

GLDAS-NOAH

GLDAS-CLSM

GLDAS-VIC

GLEAM

GLDAS-NOAH

GLDAS-CLSM

GLDAS-VIC

Uses radiation inputs from CERES after 2001, ERA-Interim before that, along with ERA-Interim surface air temperature to calculate potential evapotranspiration (PET)

Relates PET to Evaporation using a stress factor. Stress factor calculated as a function of microwave vegetation optical depth and root zone soil moisture.

Root zone soil moisture is estimated using a soil model with assimilation of microwave surface soil moisture.

GLEAM

GLDAS-NOAH

GLDAS-CLSM

GLDAS-VIC

Offline land models

Combined version 2.0 (1980-2014) with version 2.1 (2000-2020) by adding an offset to ensure the same mean over the period of overlap

2.0 forced with Princeton meteorological forcing, 2.1 forced with NCEP/GPCP

(if the issue is an issue in all land models, we wouldn't expect these land models to produce it)

# GLDAS-CLSM2.1 versus GLDAS-CLSM2.2

GLDAS-CLSM2.2 runs from Feb 2003 onwards and assimilates GRACE, which provides satellite based estimates of terrestrial water storage. Let's compare GLDAS-CLSM2.1 (with no assimilation) with GLDAS-CLSM2.2 with the GRACE assimilation.

# GLDAS-CLSM2.1 versus GLDAS-CLSM2.2

GLDAS-CLSM2.2 runs from Feb 2003 onwards and assimilates GRACE, which provides satellite based estimates of terrestrial water storage. Let's compare GLDAS-CLSM2.1 (with no assimilation) with GLDAS-CLSM2.2 with the GRACE assimilation.

# ERA5

Assimilating:

- Satellite measurements of humidity
- Station based humidity measurements
- Scatterometer measurements of soil moisture

# GLDAS-CLSM2.2

Assimilating:

- GRACE estimates of terrestrial water storage

**FORCING: ECMWF analyses**  
(versus GPCP for version 2.1)

# ERA5-Land

NO ASSIMILATION

**FORCING: meteorological fields from ERA5** (including precip with no bias correction)

# ERA5 has some peculiar precipitation trends

Area weighted averages over arid/semi-arid regions
