

From nutrients to fish: Impacts of mesoscale processes in a global CESM-FEISTY eddying ocean model framework

Kristen Krumhardt

in collaboration with Matt Long, Colleen Petrik, Mike Levy, Fred Castruccio, Keith Lindsay, Lev Romashkov, Anna-Lena Deppenmeier, Rémy Denéchère, Zhuomin Chen, Laura Landrum, Gokhan Danabasoglu, Ping Chang

Overview

- Forced ocean sea ice (FOSI) high resolution (0.1°) CESM2 simulation run on Frontera
- Forced by Japanese Reanalysis, JRA-do (1958 to 2021), historical CO₂ forcing
- 4 phytoplankton, 2 zooplankton MARBL
- Fish model called FEISTY run “offline” from 1980 to 2021 (FishErles Size and functional TYpe model)
- Talk is an overview of the documentation paper:
 - Introduce 4p2z MARBL ecosystem + FEISTY fish model
 - Model evaluation compared to available observations
 - Preliminary analysis
 - Comparisons to 1° version of the run (“FOSI-HR” vs. “FOSI-LR”)

CESM-MARBL

FEISTY

Sea ice looks good!

- Important control on Antarctic and Arctic ecosystems
- Sea ice extents in both hemispheres match observations better than 1°

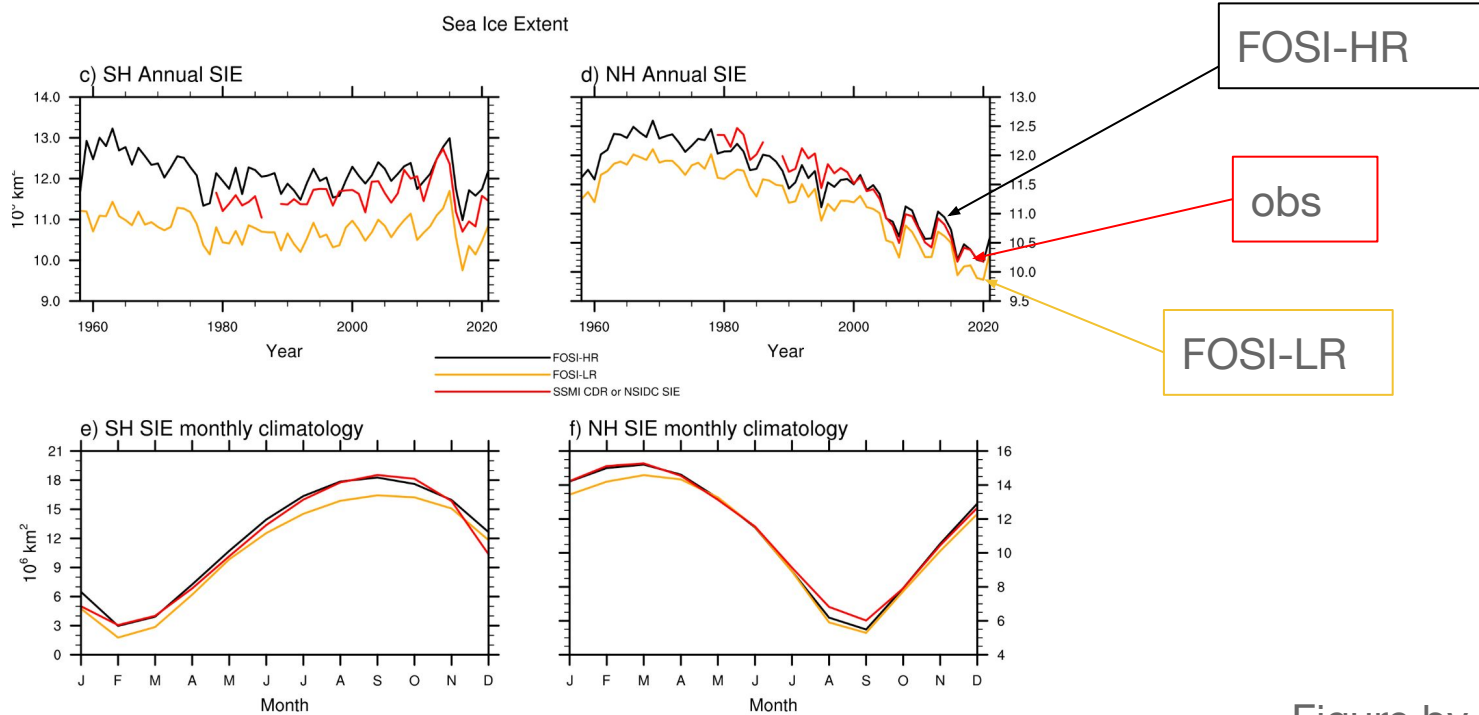

Figure by Laura Landrum

Oxygen compared to GOBAI-O2 observational product

- Difference maps at 400 m depth, highlights biases in model solution
- Negative biases in FOSI-LR are much reduced in FOSI-HR
- FOSI-HR was initialized with LR spinup

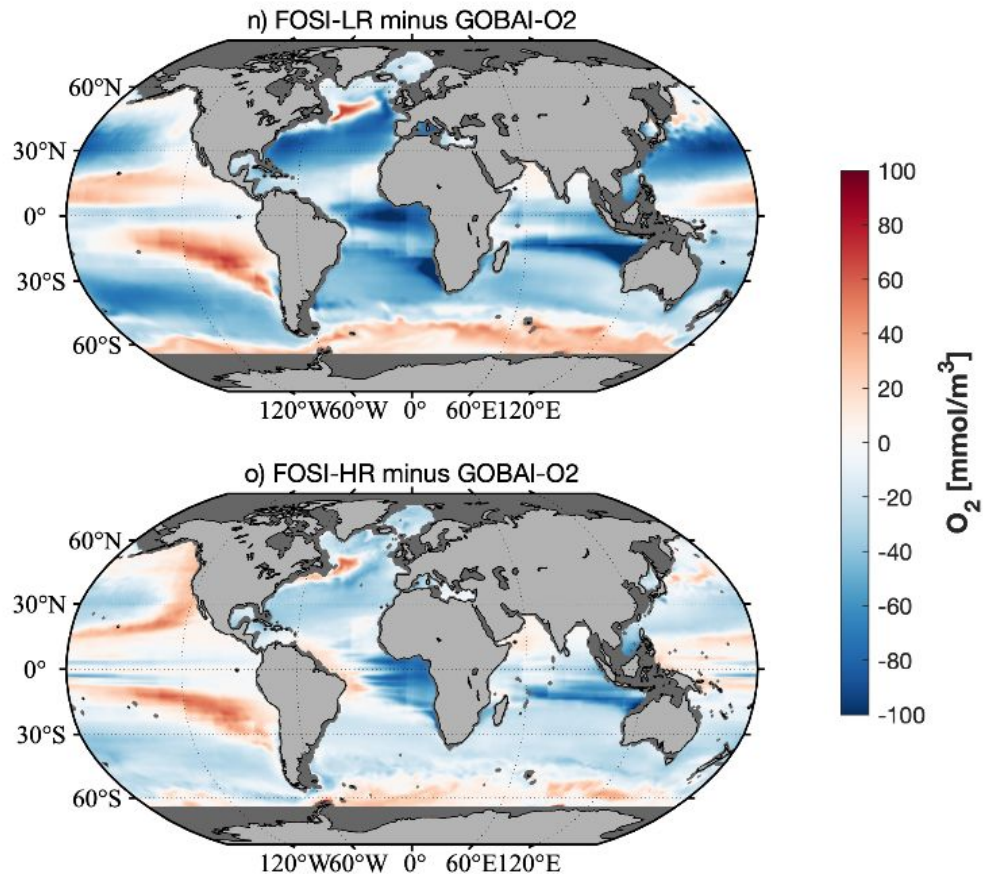

Figure by Zhuomin Chen

Large scale geographic patterns in plankton look reasonable

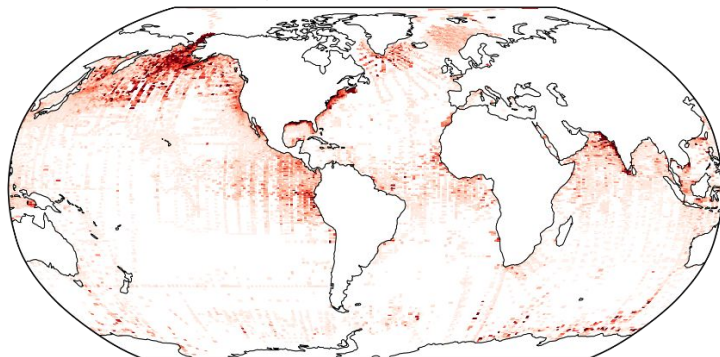

a) GlobColour chlorophyll

b) FOSI-HR chlorophyll

c) COPEPOD dataset

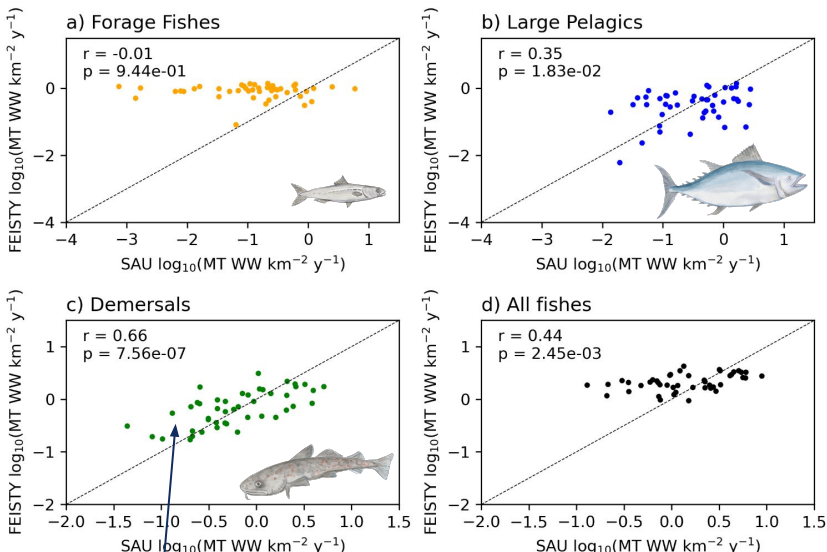

d) FOSI-HR mesozooplankton

We compared FEISTY-HR fish “catches” to reported fish catches in Sea Around Us database

Mean state evaluation in Large Marine Ecosystems

Comparing time series of fish catch in a few LMEs

Each dot represents mean fish biomass in one LME

Figure by Lev Romashkov

Large scale biogeography in FOSI-HR and FEISTY-HR

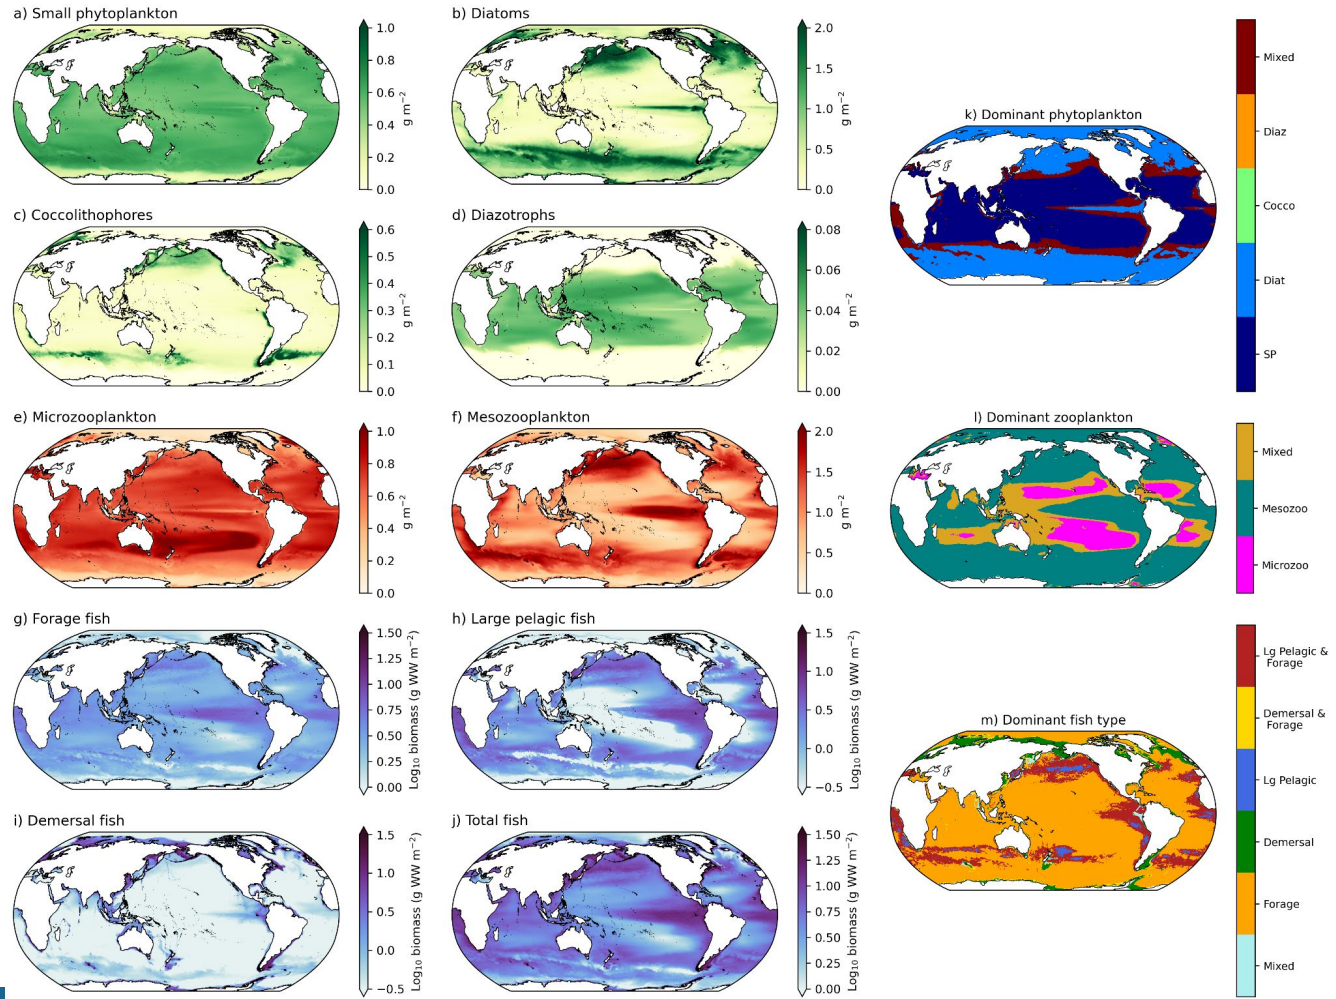

Phytoplankton →

Zooplankton →

Fish →

Fish biomass responds to climate forcing

- Both fish types drop during El Niño
- Forage fish recover faster

El Niños in purple

Comparing marine NPP in high resolution and low resolution

California current region

a) FOSI-HR NPP, March 1999

b) FOSI-LR NPP, March 1999

d) FOSI-HR NPP, March 1999

e) FOSI-LR NPP, March 1999

SE US Shelf

c) California Current LME NPP

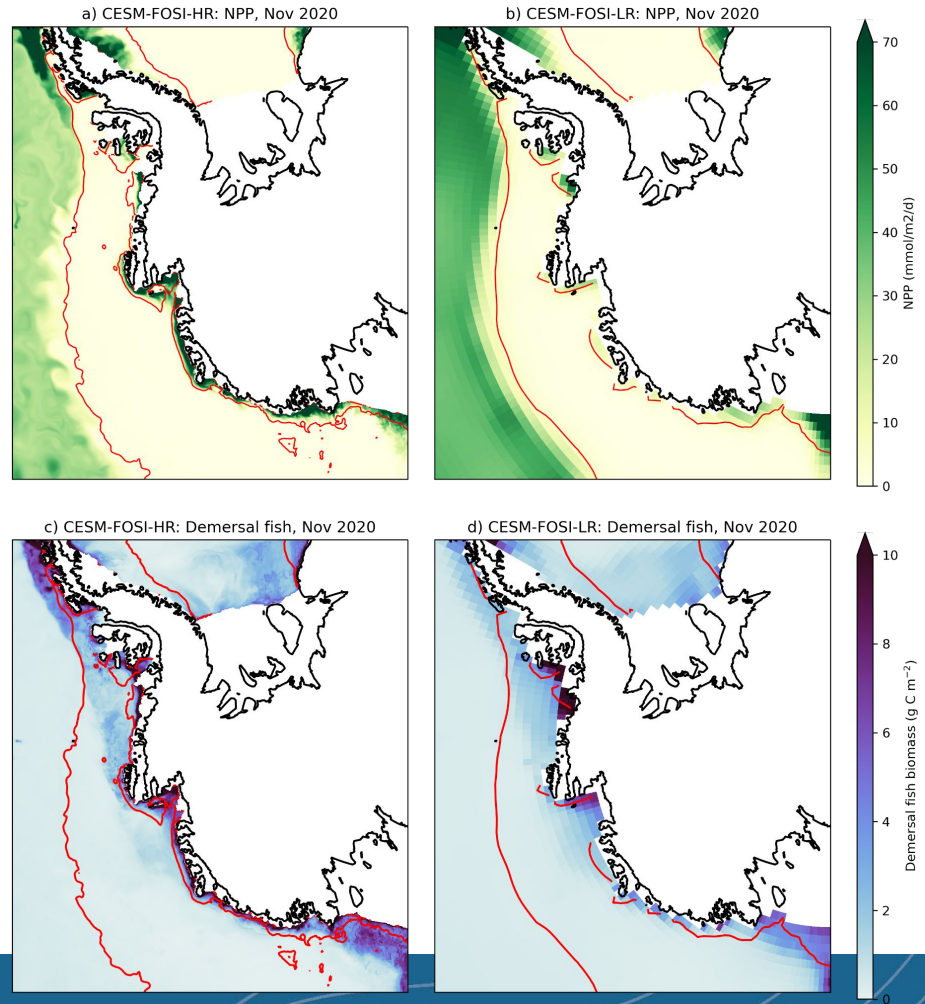

f) SE US shelf LME NPP

FOSI-HR and FEISTY-HR in the Antarctic

- Antarctic coastal current resolved in the CESM-HR in the Amundsen and Bellingshausen Seas
- Important during springtime, showing November snapshots
- Top plots: NPP
- Bottom plots: demersal fish
- Important food resource for Antarctic marine predators (seals, penguins)

Looking at the BGC/ecosystem response to “The Blob” MHW in the NE Pacific

- May 2015 anomalies relative to 1980-2000 climatology
- Increases in NPP & mesozoo biomass to the north, decreases to the south
- Fish response?

a) FOSI-HR SST anomaly, May 2015

b) FOSI-HR NPP anomaly, May 2015

c) FOSI-HR Mesozoo biomass anomaly, May 2015

Thank you for your attention!

- Just submitted manuscript documenting the run to *Progress in Oceanography*
- Preprint will be soon available on [earthArxiv.org](https://eartharxiv.org) (or just ask me for it!)
- Data from the FOSI-HR and FEISTY-HR is publicly available on a [Globus Guest Collection](#)
- And also readable on glade:
`/glade/campaign/cgd/oce/projects/FOSI_BGC/HR/g.e22.TL319_t13.G1850ECOIAF_JRA_HR.4p2z.001`

Tropical instability waves in the equatorial Pacific influence NPP

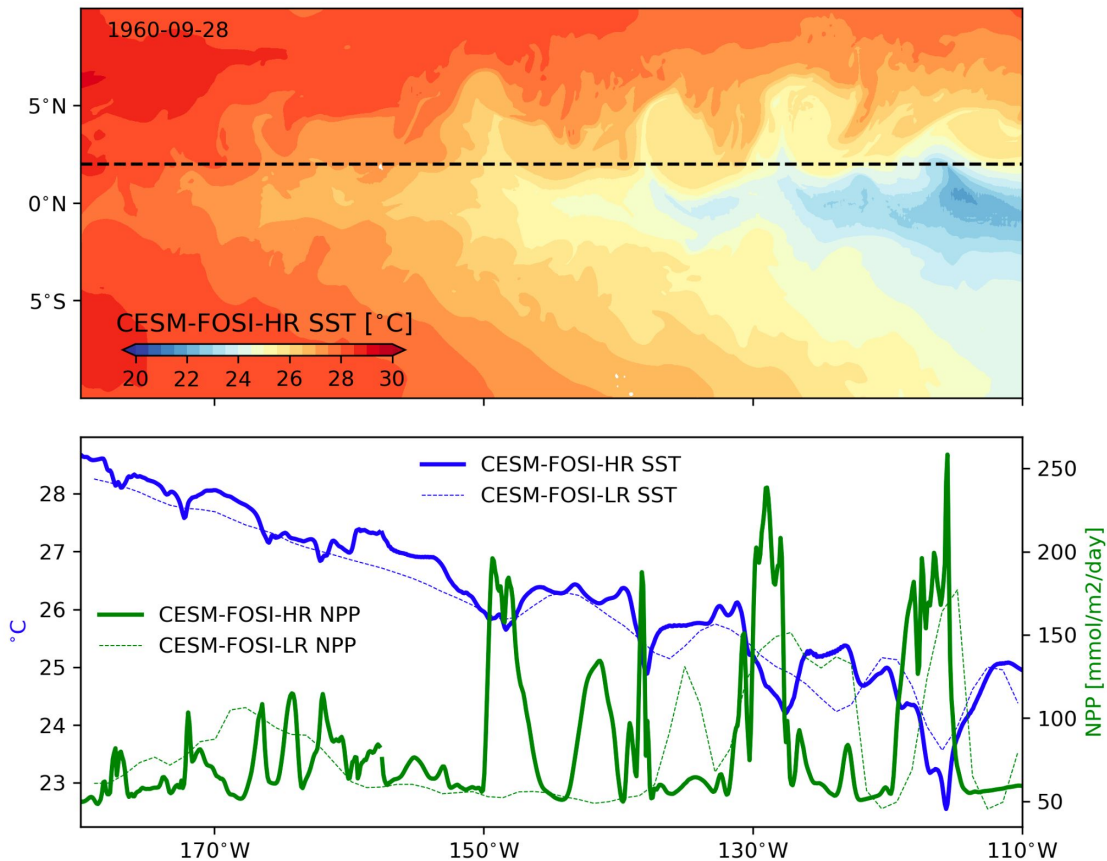

Figure by Anna-Lena Deppenmeier

a) SST-California Current -

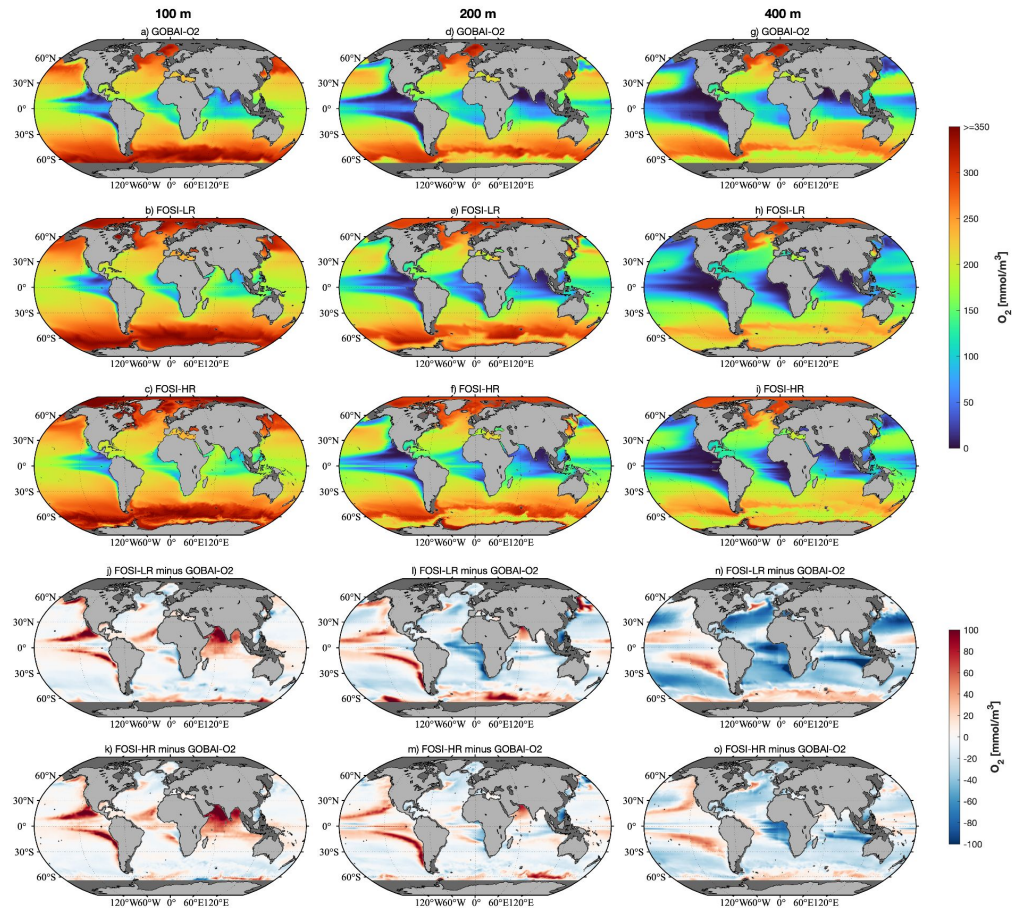

a) SST and b) SSH anomaly averaged over the upwelling zone (100km westwards from coast: 36-44deg. N) from monthly-averaged data. Monthly long-term mean and linear trend has been removed and a 3-month running mean applied. The legend is shown in panel a). The black line (OBS) is data from a) OISST (Reynolds et al. 2007) and b) CMEMS/AVISO.

Large scale biogeography in CESM-HR and FEISTY-HR

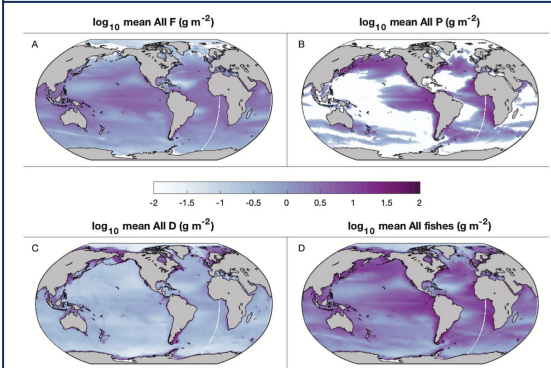

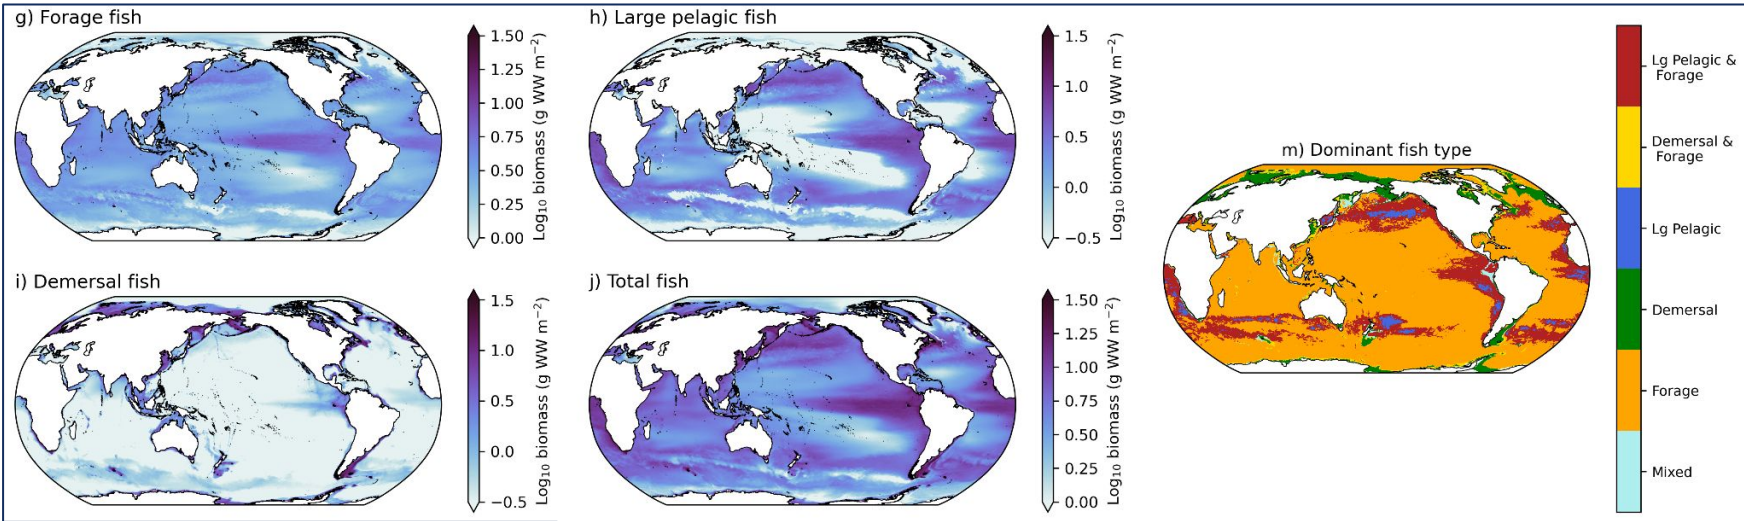

Fig. 7. Simulated global \log_{10} biomass (g m^{-2}) of (A) forage fish, (B) large pelagic fish, (C) demersals, and (D) all fishes combined.

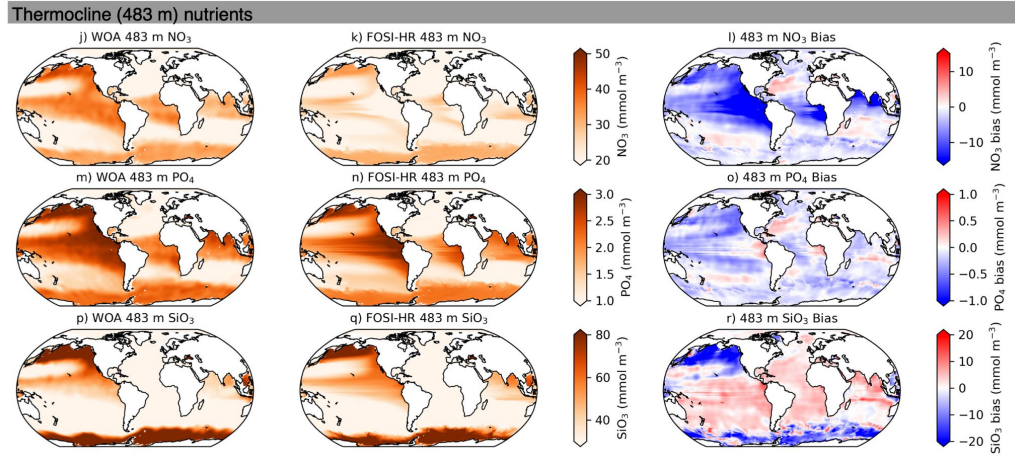

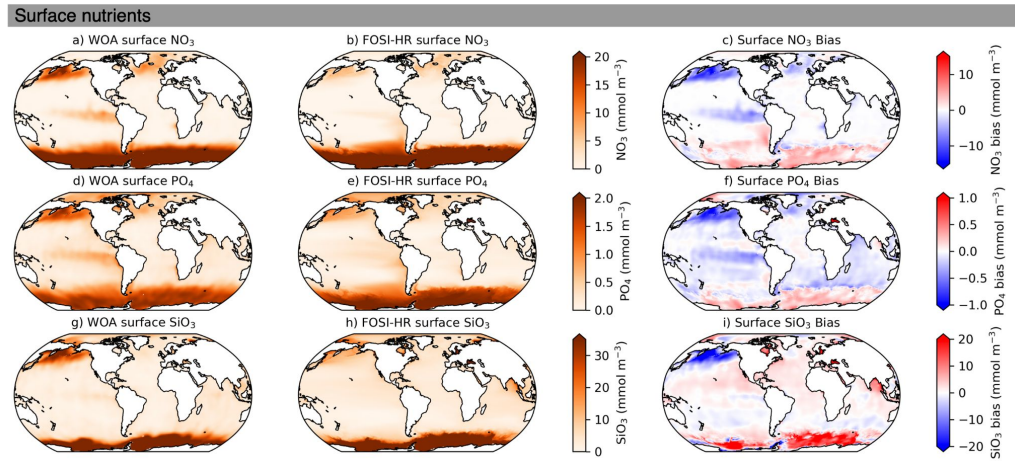

- Large-scale fish biogeography looks similar to Colleen's 2019 paper using GFDL model
- Forage fish dominate most places
- Demersal fish dominate in shelf regions
- Mixed fish assemblages in high productivity regions

Dominant fish type may vary from year to year

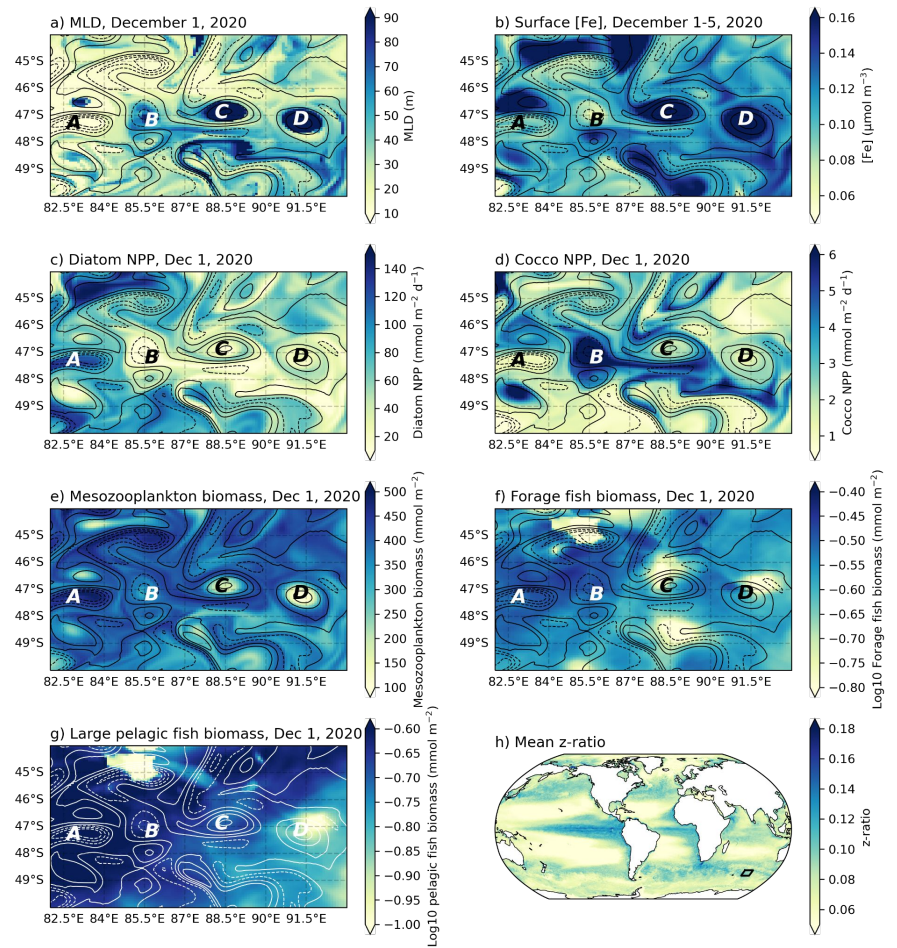

Dominant fish type, 1980

Nutrient validation

Eddies influence trophodynamics
