This study is funded by the ISRO Geosphere Biosphere Program (IGBP)

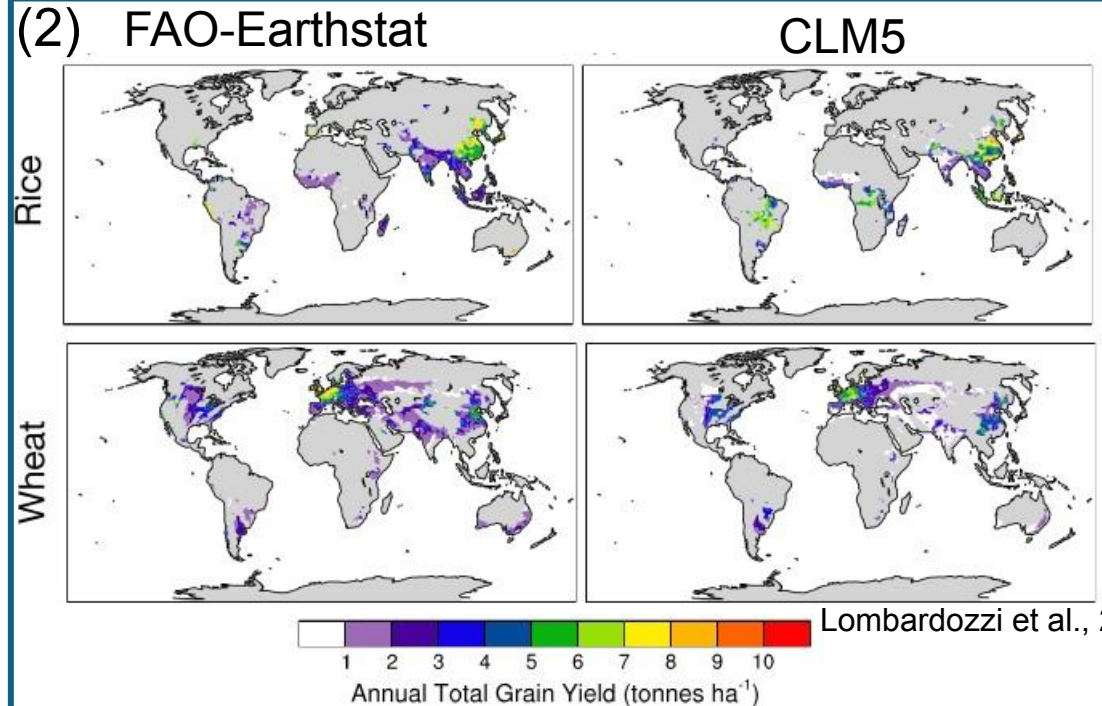

# Major Indian crops in LSMs

Gahlot et al., 2020

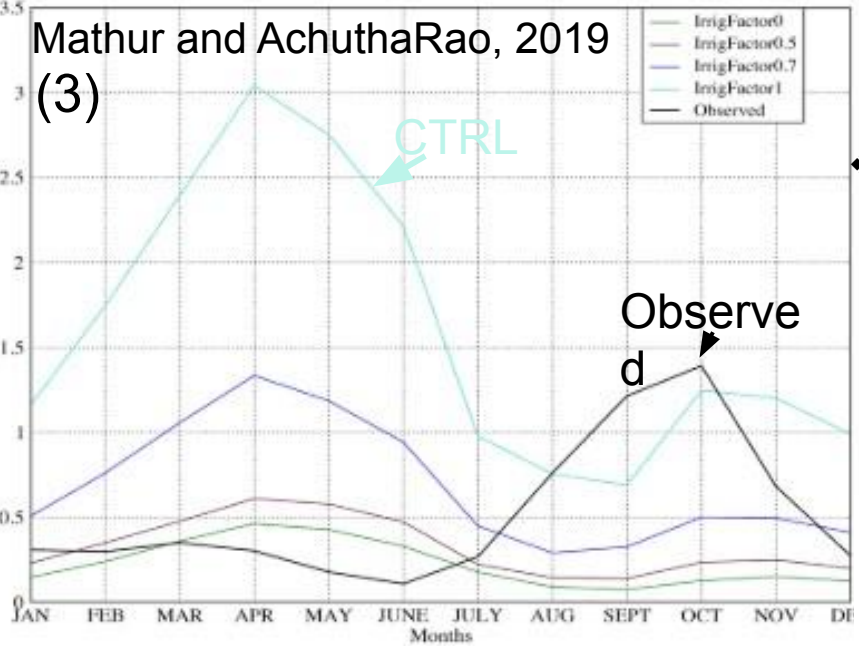

**Figure 1.** Model calibration and validation plots for the experimental wheat site at IARI, New Delhi. (a) Model calibration for above-ground biomass for the 2015–2016 growing season. (b) Model calibration for LAI for the 2015–2016 growing season. (c) The model-estimated LAI validated with site-measured data for the 2014–2015 growing season. The red dots are site-measured values and the black lines are ISAM-simulated values.

❖ Lack of openly accessible crop datasets for calibration and validation limits crop modelling studies in the Indian region (Gahlot et al., 2020).

Lombardozi et al., 2020

❖ Major Indian crop yield estimates in CLM5 have large biases compared to FAO observation data (Lombardozi et al., 2020).

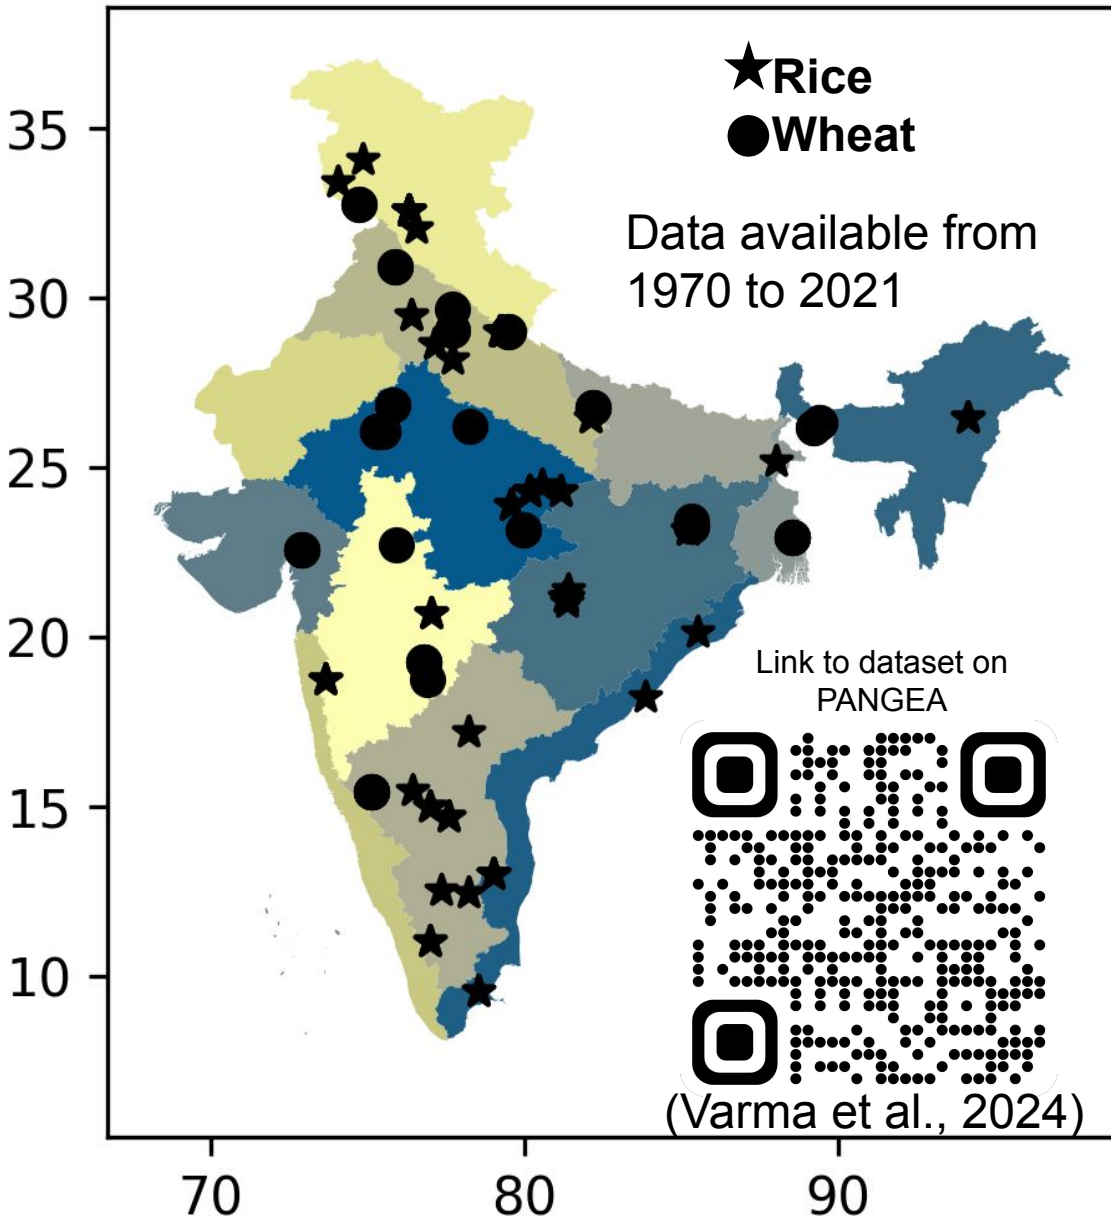

Mathur and AchuthaRao, 2019

❖ Irrigation water added simulated by CLM for Indian region are far from observations

**Fig.12** Annual cycle climatology of irrigation water added (mm/day) in the different irrigation factor experiments shown along with observed estimates used in Cook et al. (2015) based on the work of Wisser et al. (2010). The data is shown only for grid cells where greater than 20% PFTs (Supplementary Figure S13) are irrigated crop types predominantly in the Indo-Gangetic plain

# Crop dataset from experimental agricultural site

- Site-scale observations of Indian crops are very rarely available for public access.
- Students at agricultural institutes across India conduct experiments on Indian crops and report their results (Veeranjaneyulu, 2014).
- To fill the gap of crop data on Indian crops, we started to assemble data on wheat and rice in a formatted, machine-readable format that can be downloaded and used for model development. The data is available on the PANGEA data repository (Varma et al., 2024).

# Wheat and rice in CLM5

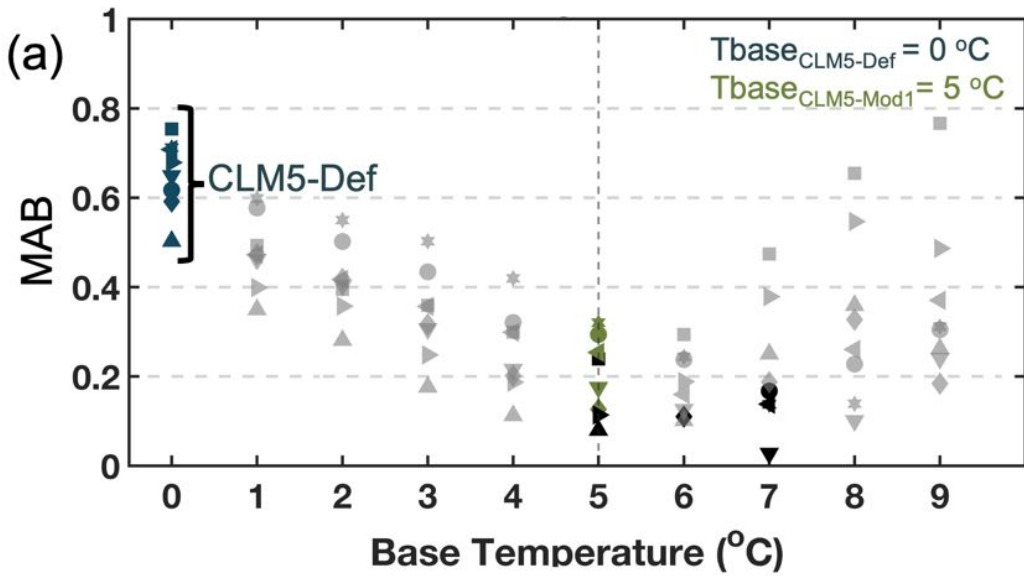

- ❖ The current study uses the CLM5 model with the data atmosphere model (DATM).
- ❖ The GSWP3 atmospheric data is used for the simulations.
- ❖ We ran CLM5 at two different spatial resolutions from 2000 to 2014:
  - ❑ site-scale simulations to calibrate the crop module, and
  - ❑ regional simulations to compare the calibrated model against remote sensing data and derived surface flux data.

Parameter	Description (units)	Wheat		Rice	
		CLM5 Def	CLM5 Mod1	CLM5 Def	CLM5 Mod1
<b>min_NH_planting_date</b>	Minimum planting date for the Northern hemisphere (MMDD)	401	1115 (calibrated in this study)	101	701 (calibrated in this study)
<b>max_NH_planting_date</b>	Maximum planting date for the Northern hemisphere (MMDD)	615	1231 (calibrated in this study)	228	815 (calibrated in this study)
<b>min_planting_temp</b>	Average 5 day daily minimum temperature needed for planting (K)	272.15	283.15 (Rao et al., 2015)	283.15	294.15 (Kumar et al., 2023)
<b>planting_temp</b>	Average 10-day temperature needed for planting (K)	280.15	290.15 (Asseng et al., 2016; Mukherjee et al., 2019)	294.15	300.15 (Jat et al., 2019)

# Results: Wheat at site-scale

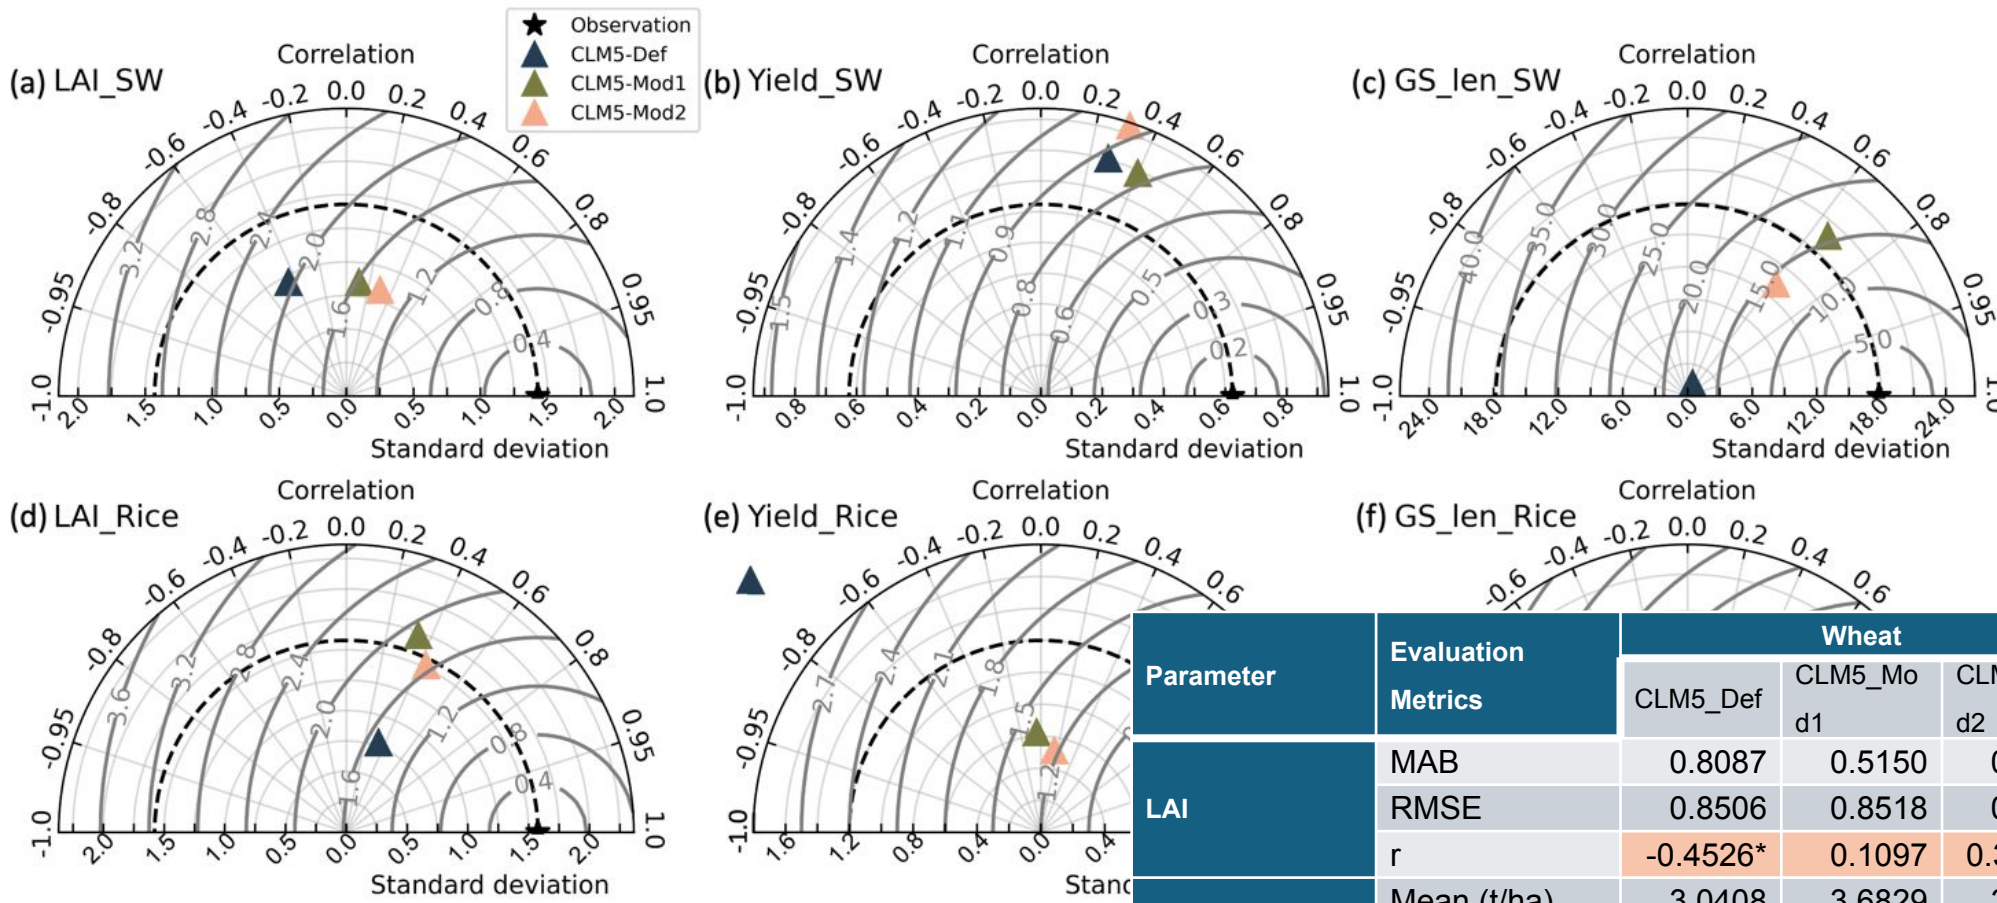

# Results: Rice at site-scale

# Results: Wheat and Rice at site-scale

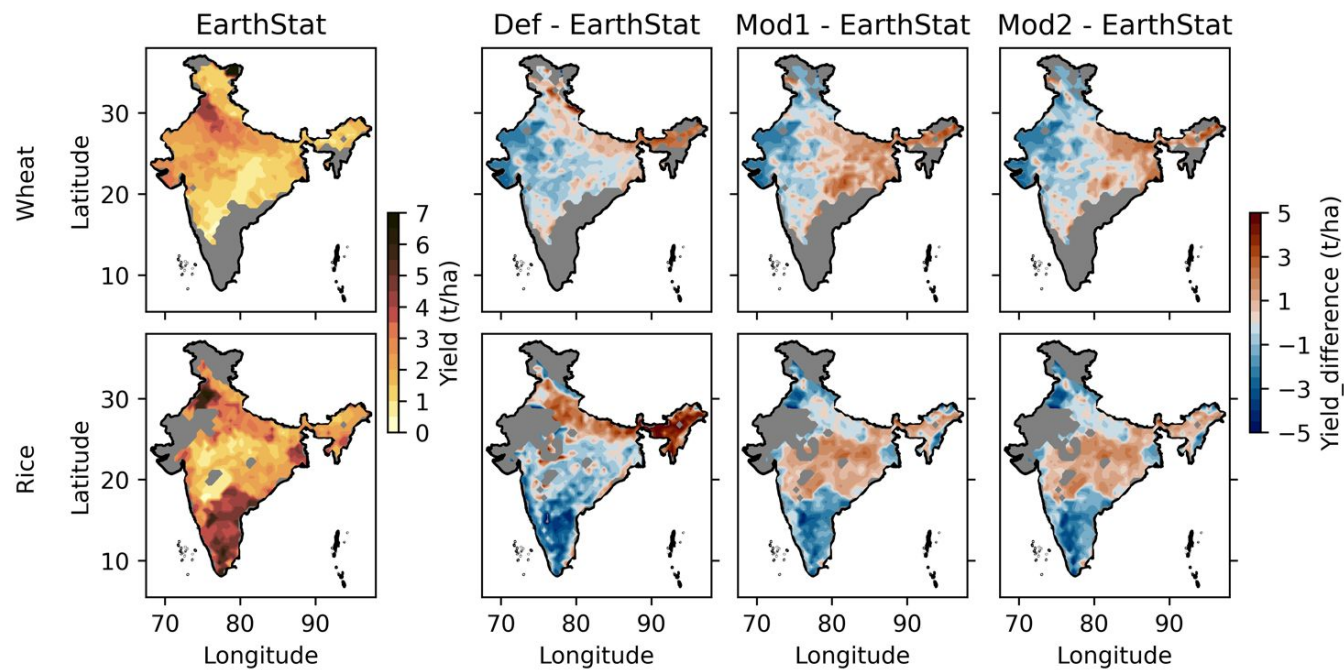

- ❖ Yield in rice crop has seen the largest improvement.
- ❖ Growing season length in wheat was just 68.77 days on an average across sites as simulated in default case.

# Results: Wheat and Rice at regional scale

❖ Considerable improvement in yield projections of rice in the modified cases.

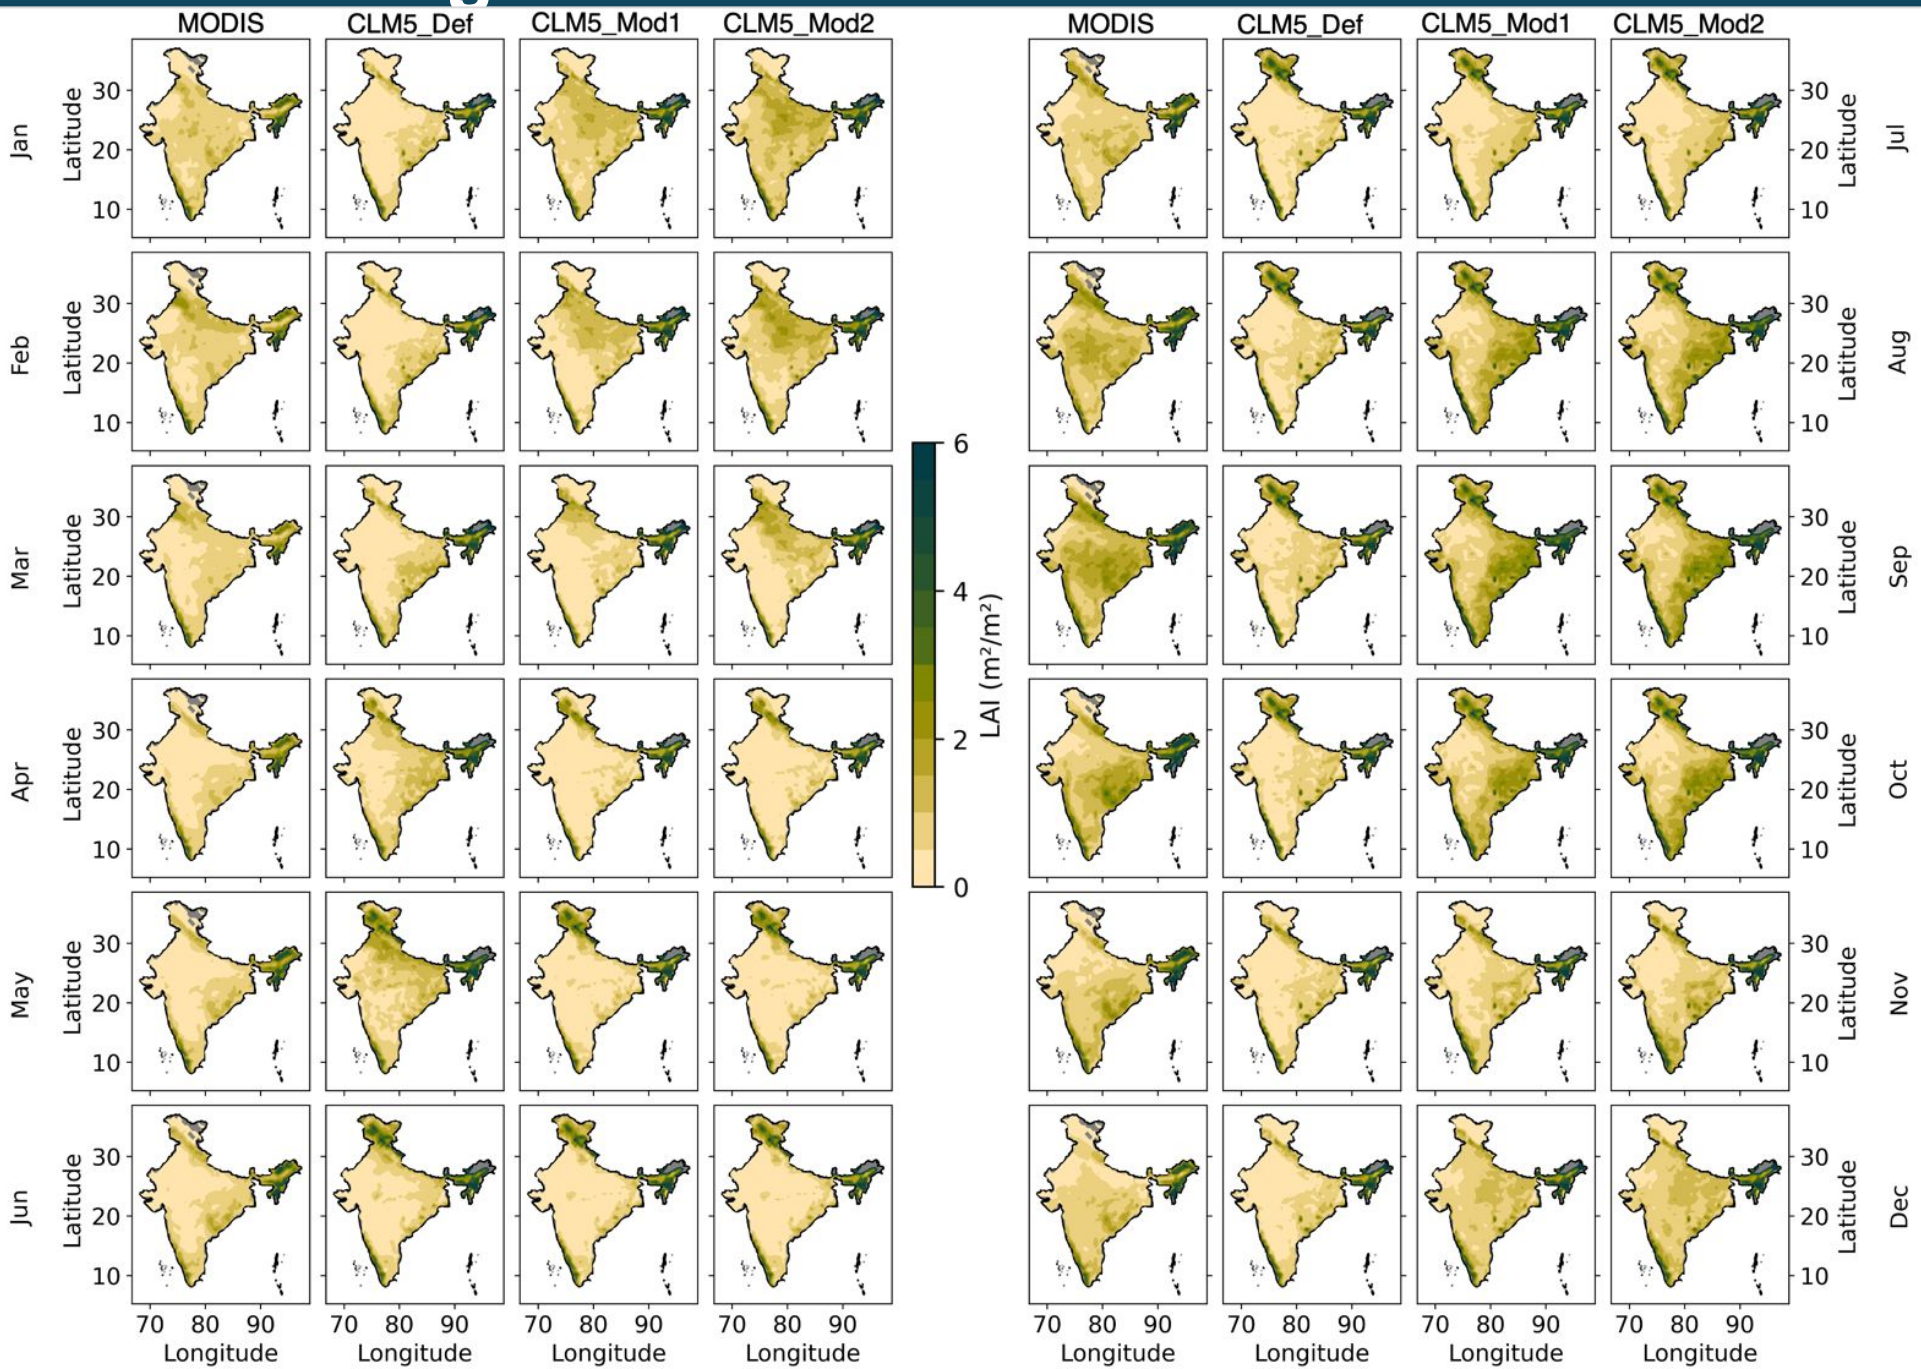

❖ The unexpected peak in irrigation found in Mathur and AchuthaRao. (2019) is the result of wrong cropping patterns of wheat and rice in India. This error in simulating irrigations patterns is reduced in the modified cases.

❖ The amount of water added through irrigation has reduced by 25% in the case of wheat and nearly 60% in the case of rice growing regions.

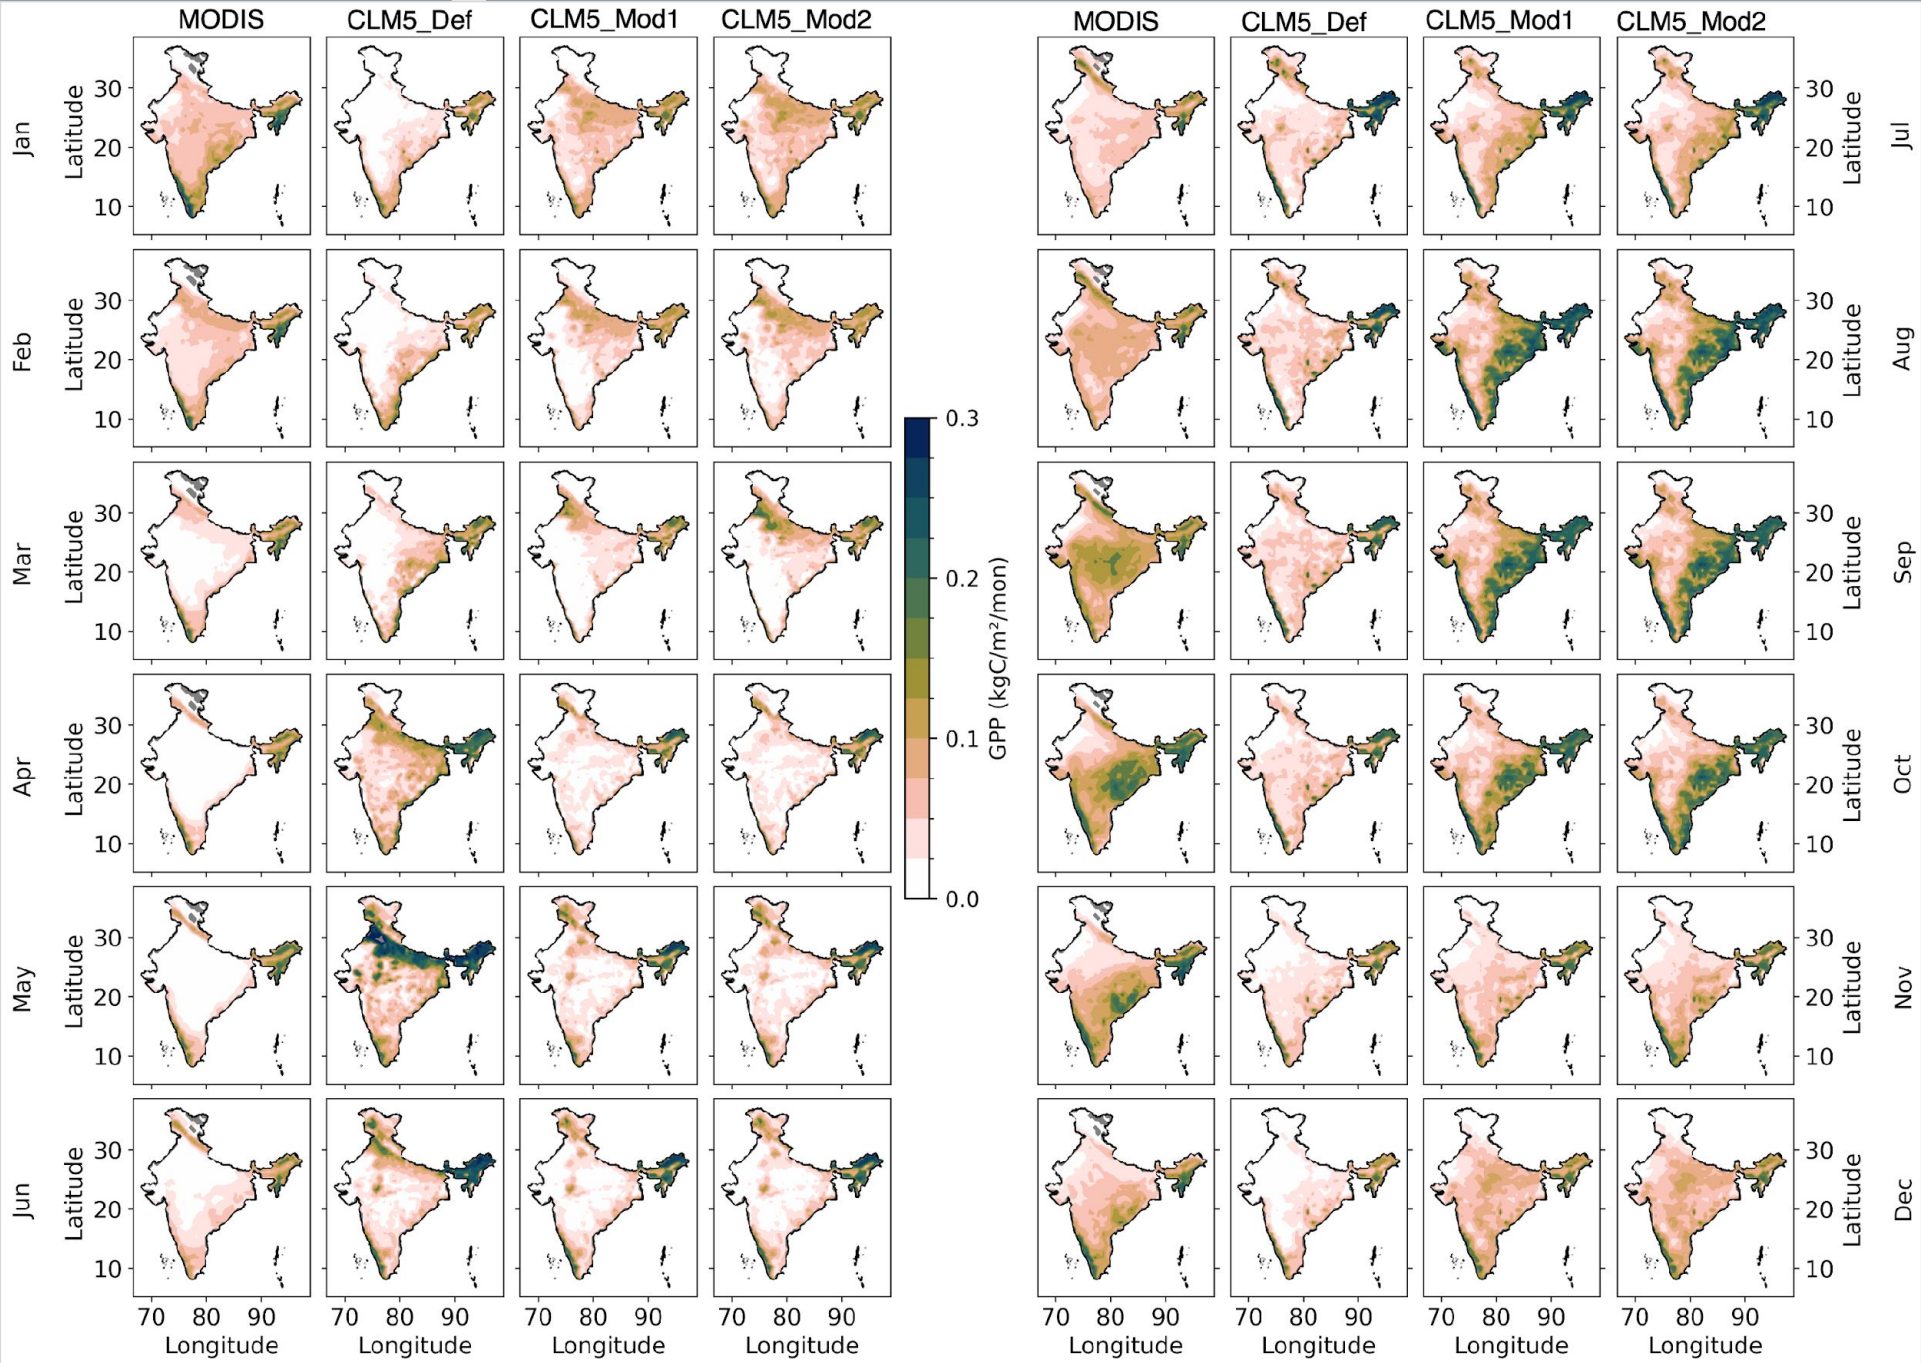

# Results: CLM5 at regional scale - LAI

Spatial variation of LAI simulated by CLM5 against MODIS data. The data shows the monthly LAI averaged over 2000-2014.

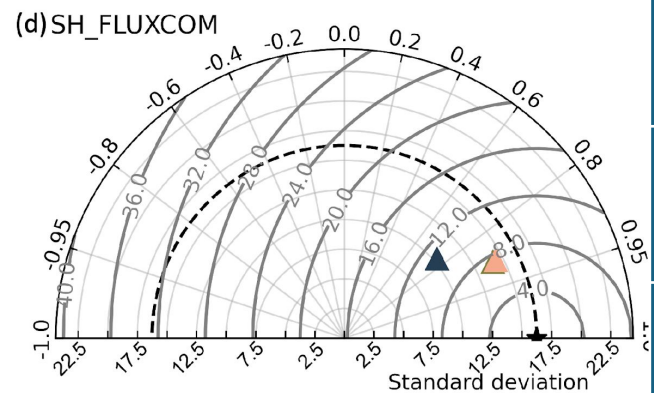

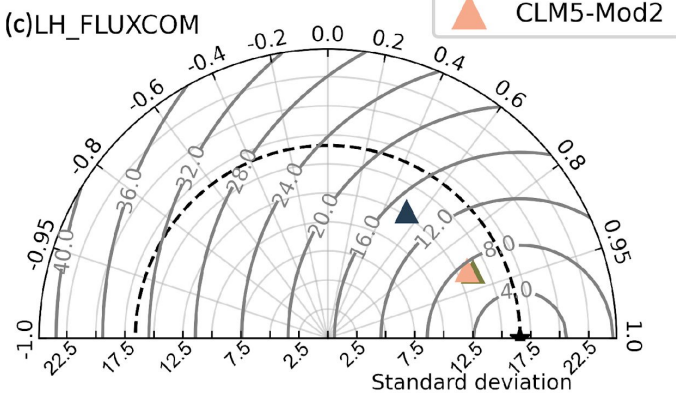

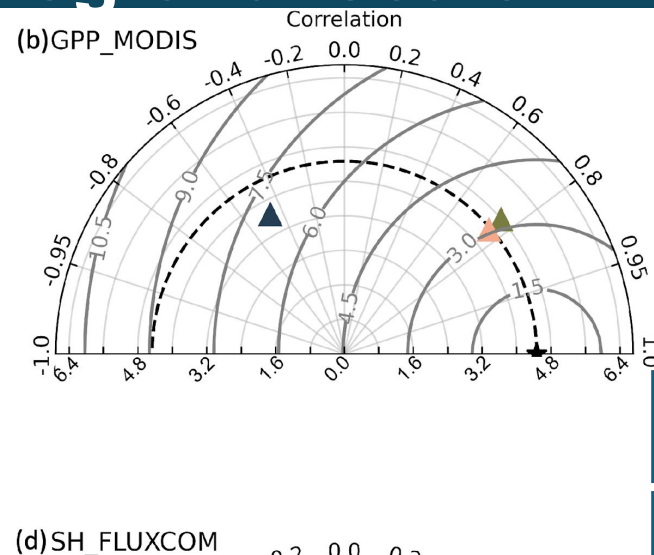

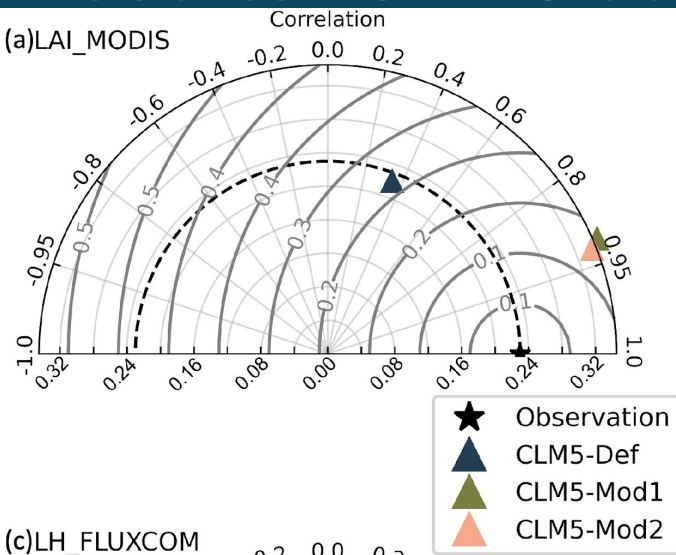

# Results: CLM5 at regional scale - GPP

Spatial variation of LAI simulated by CLM5 against MODIS data. The data shows the monthly LAI averaged over 2000-2014.

# Take Home

- ❖ Current study is an example on how the accurate representation of regional crops improves the carbon, energy and water fluxes simulated by land surface model.
- ❖ The crop parameters should be defined at grid level instead of defining globally to allow for regional variability.

!! Special thanks to Peter Lawrence.
