

# Comparison of CTSM coupled river models

**MOSART vs. mizuRoute**

*Presented by Naoki Mizukami*

*NFS-NCAR/RAL(Research Application Lab)*

*Acknowledge to Erik Kluzek and Dave Lawrence and TSS*

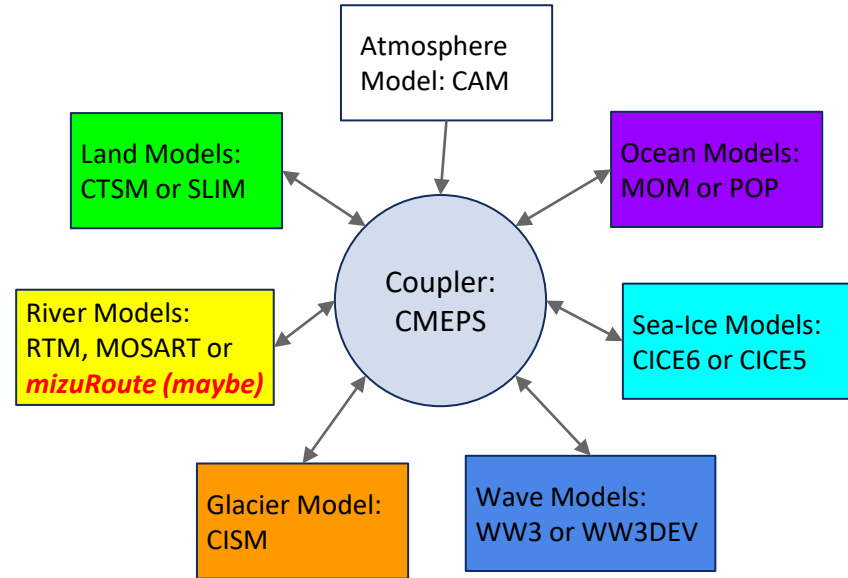

February 28, 2024

# Introduction

- Planning to move CESM River component from MOSART (grid routing) to mizuRoute (vector routing).
- Need to understand differences in model behaviors to justify this plan. 1) Model skills and 2) performance
- New physics: Floodplain implementation

## CESM3 (and beyond) components

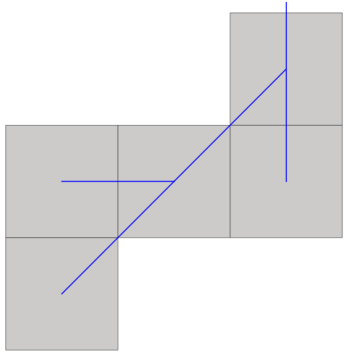

From Erik Kluzek

# MOSART (in CESM) vs. mizuRoute

## MOSART (Model for Scale Adaptive River Transport)

- Gridded network
- Three routing processes at each element.
  - hillslope
  - Sub-grid tributary
  - Channel (kinematic wave)

## mizuRoute

- Vector network
- Two routing processes at each element.
  - hillslope
  - Channel (multiple methods)

# Model setups

CTSM5.1 f09\_f09 grid (0.5°)

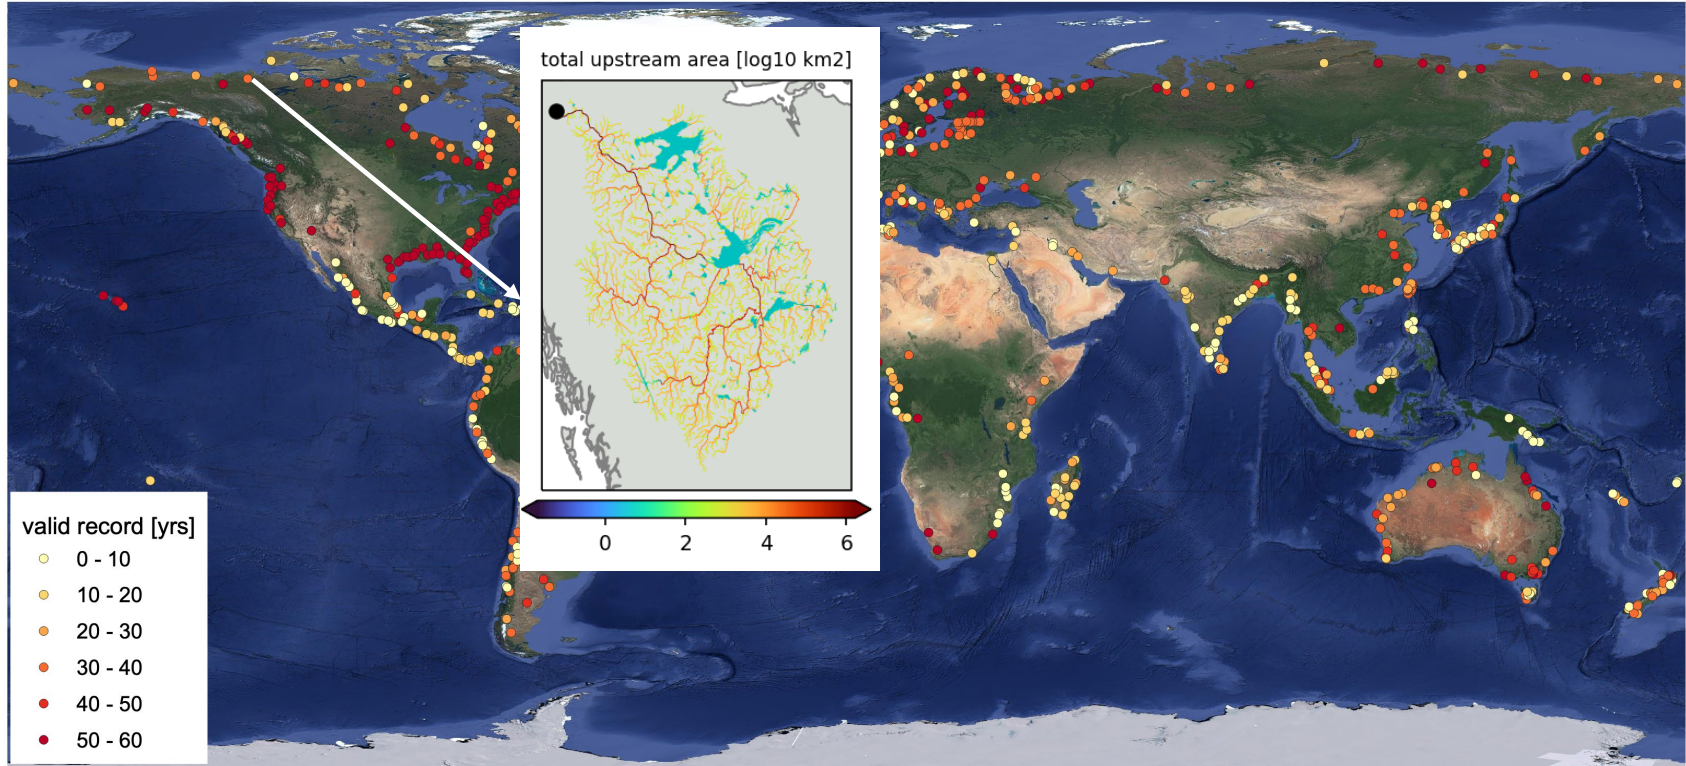

GSWP3 forcing

Sim. period: 1960-1999

## River configurations

	model	grid
mosart 0.5°	MOSART	0.5° (94,613 land / 259,200 total)
mizuRoute HDMA	mizuRoute (IRF routing)	HDMA (295,335 basins)
mizuRoute HDMA+lake	mizuRoute (IRF routing)	HDMA with hydroLakes (294,041 basins, 4236 lakes)
mizuRoute HDMA+lake irrigation	mizuRoute (IRF routing)	HDMA with hydroLakes
mizuRoute HDMA+lake dfw	mizuRoute (diffusive wave routing)	HDMA with hydroLakes
mizuRoute 0.5°	mizuRoute (IRF routing)	0.5°

# D19 - Monthly reference flow sites (near oceans)

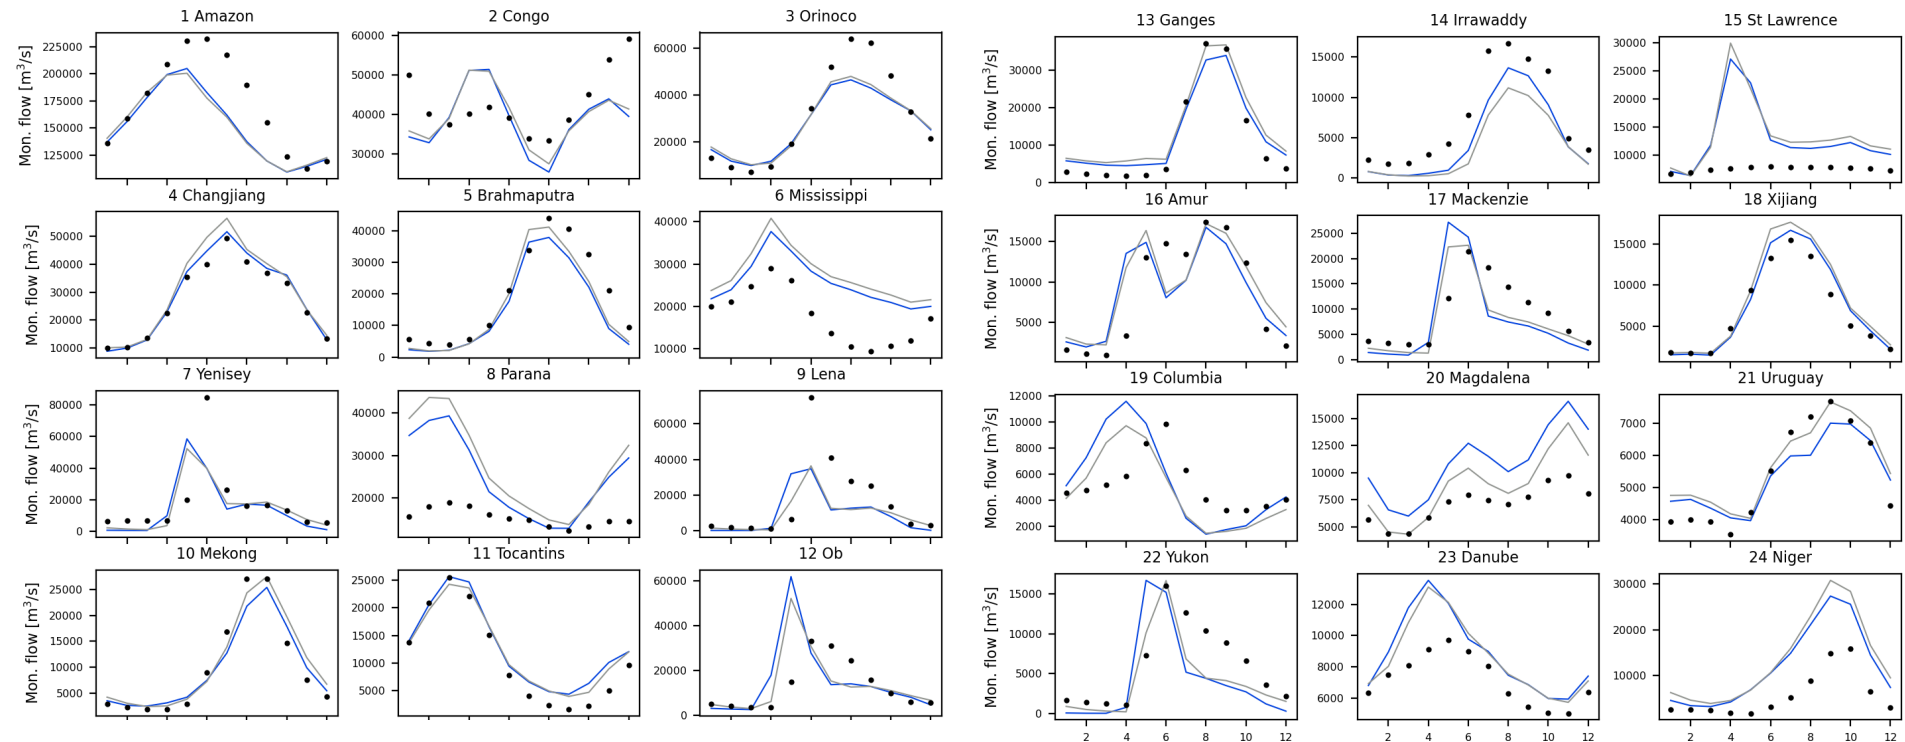

922 River sites, providing long-term monthly flow based on observed data (USGS, GRDC etc.) and CLM (using CLM-obs relationship) for missing data (Dai et al., 2009; Dai 2019)

## B14 - Daily reference flow sites (including interior)

21,884 gauge sites (USGS, GRDC etc.) providing daily observed flow with varying recode lengths (Beck et al., 2014). Note all the gauges are not captured by modeled river network.

# Seasonality (1960-1999) – MOSART vs mizuRoute

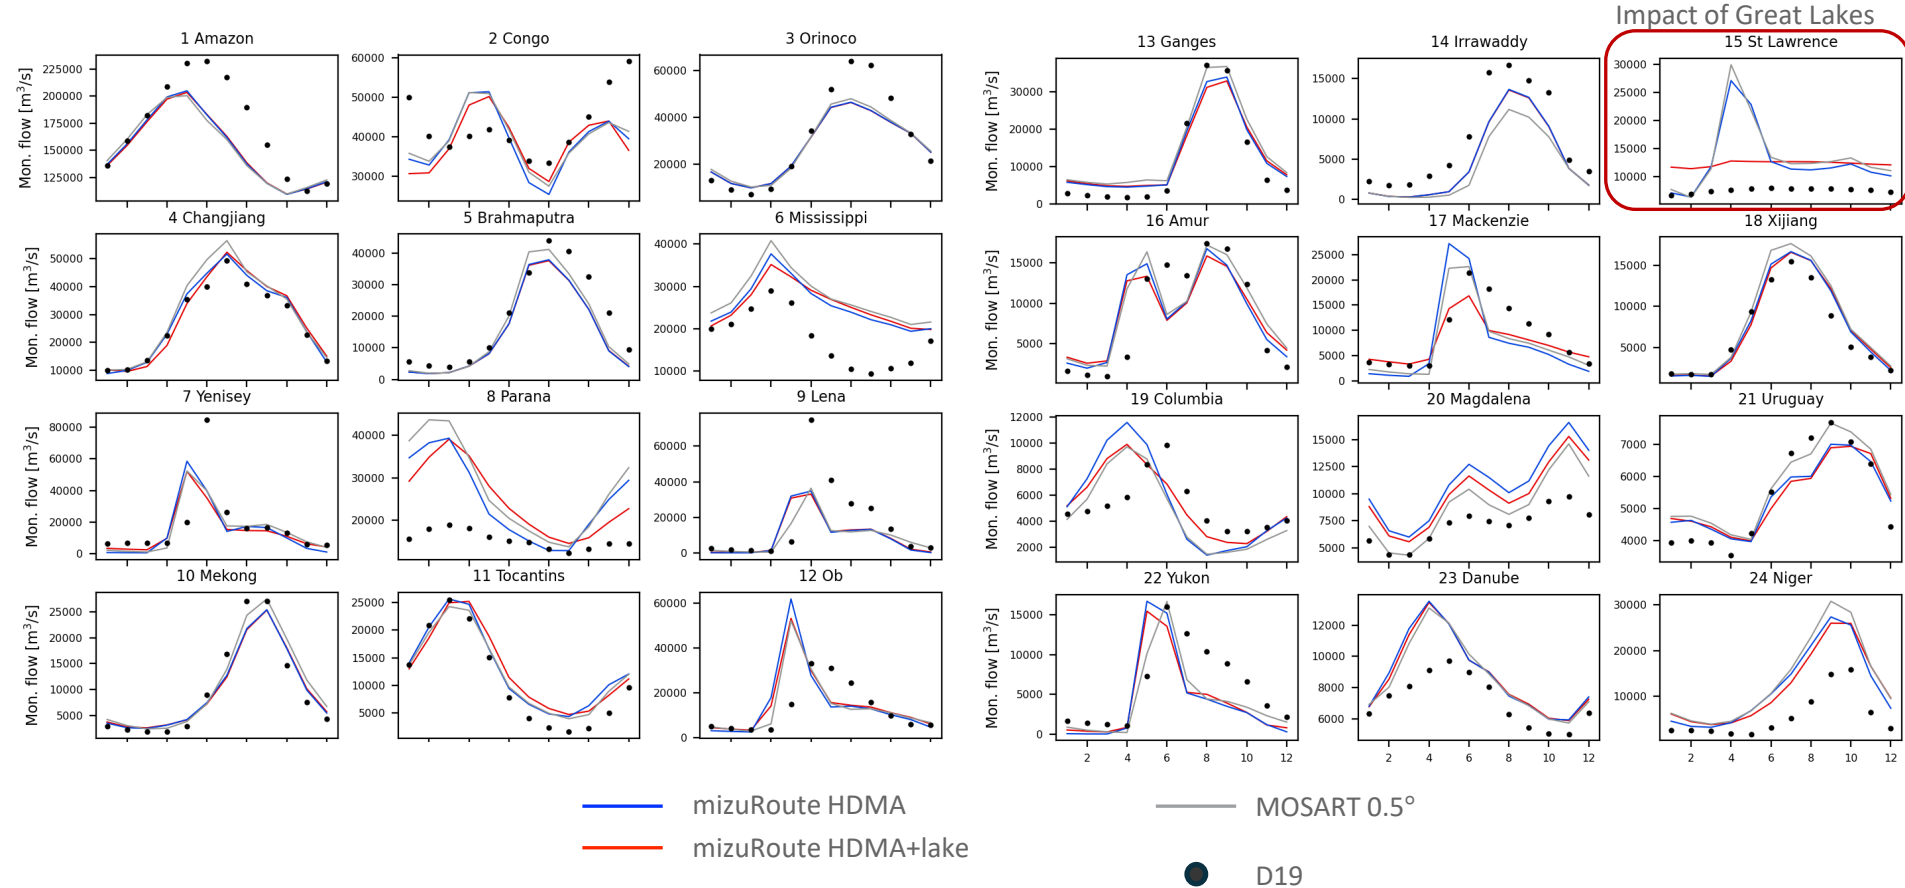

— mizuRoute HDMA

— MOSART 0.5°

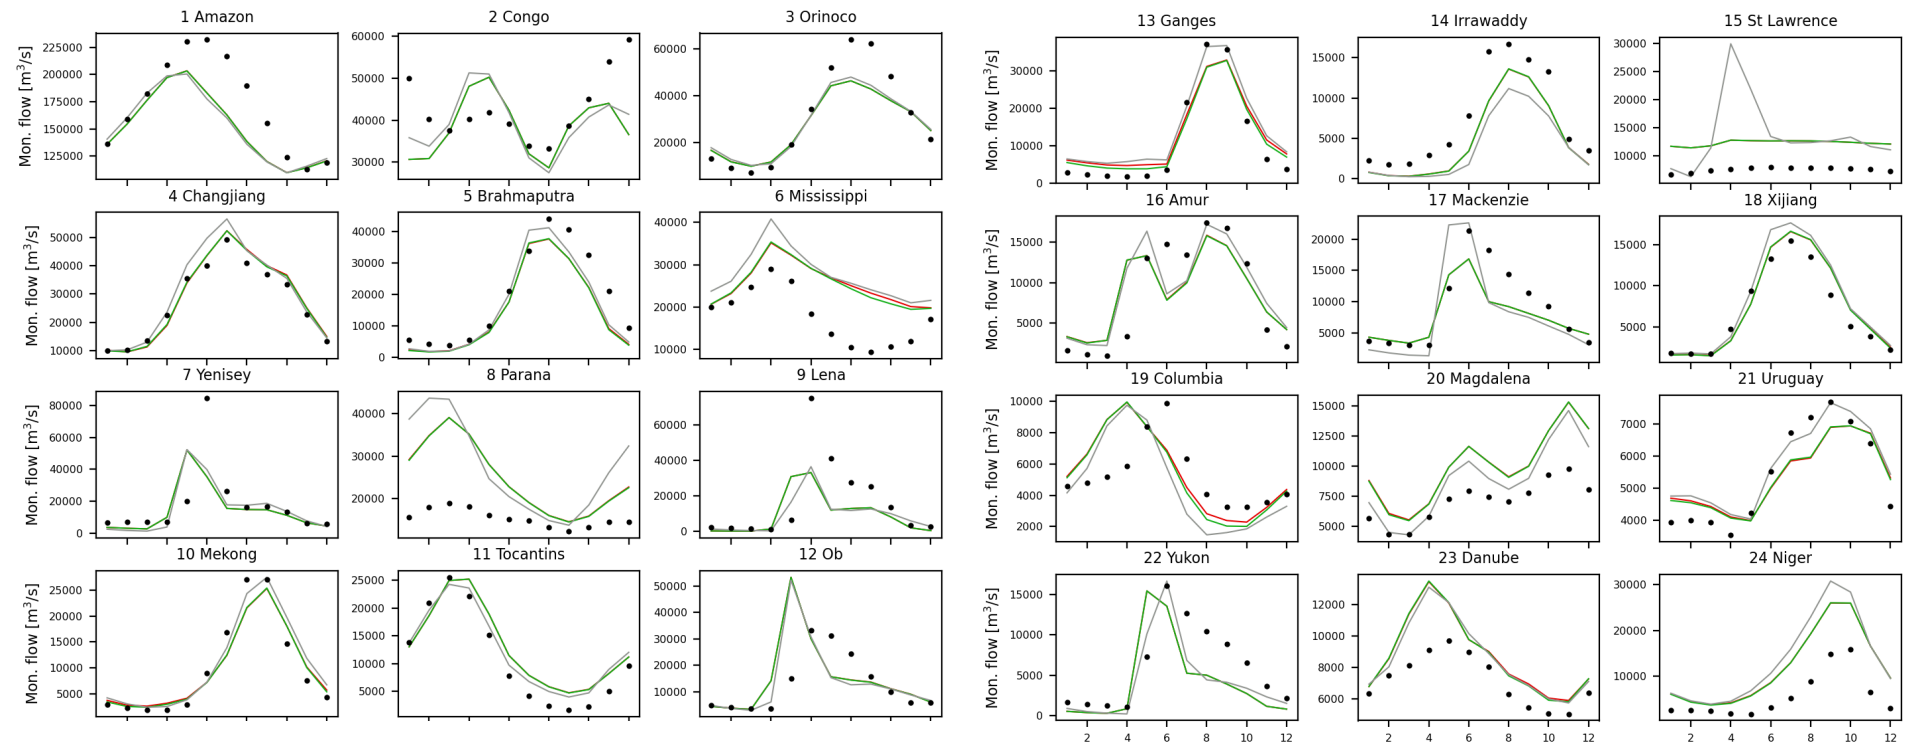

● D19

# Seasonality (1960-1999) – no lake or lake

# Seasonality (1960-1999) – irrigation or not

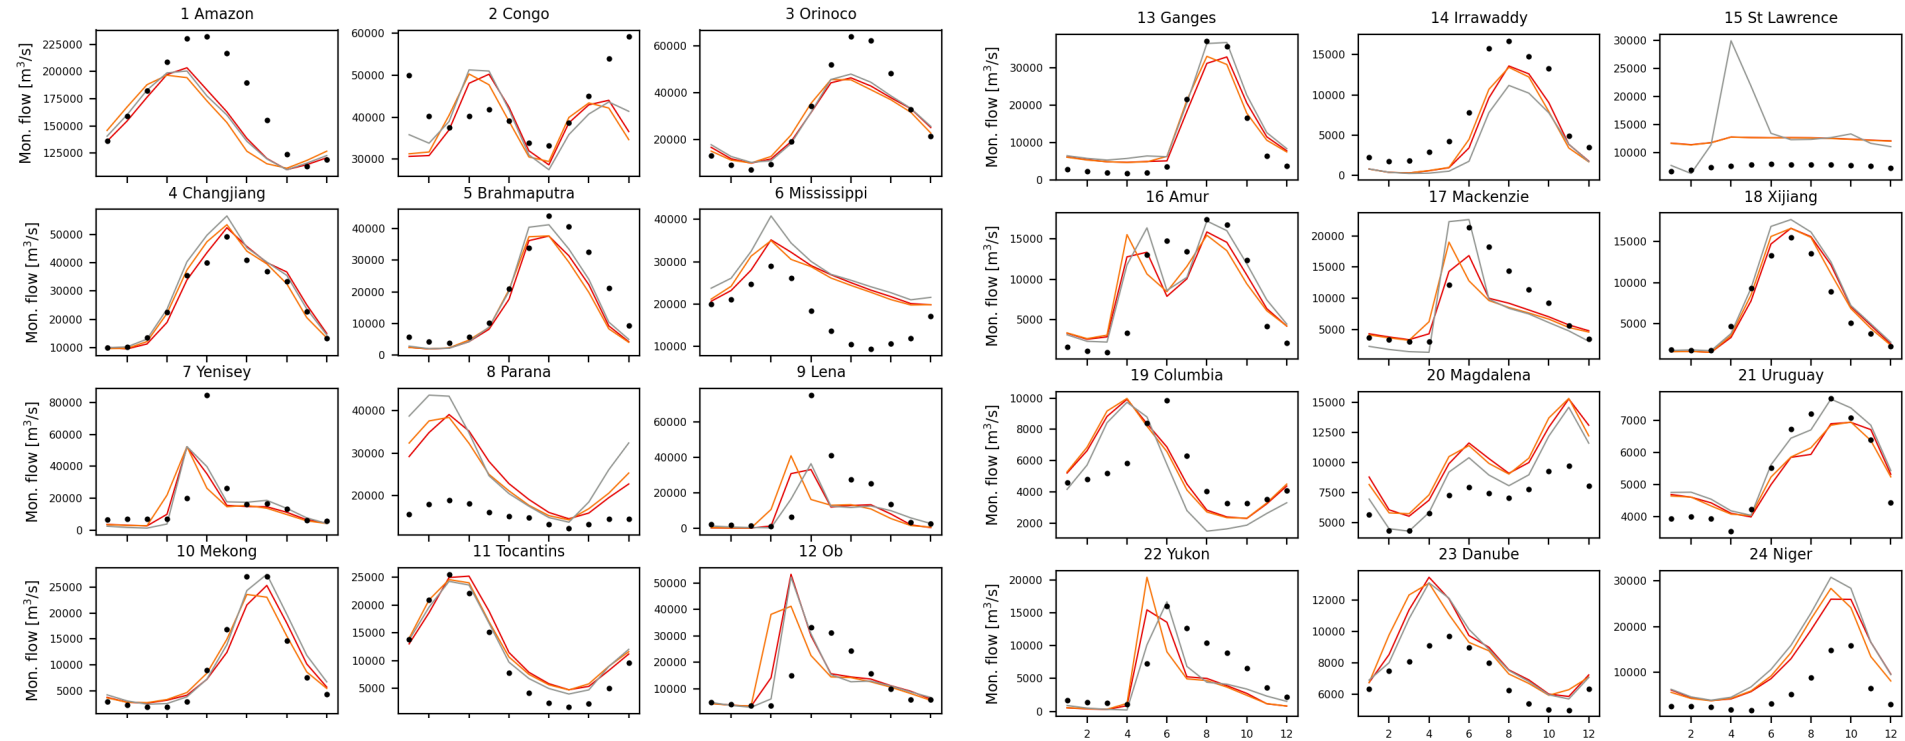

— MOSART 0.5°

— mizuRoute HDMA+lake

— mizuRoute HDMA+lake irrigation

● D19

# Seasonality (1960-1999) – routing effects

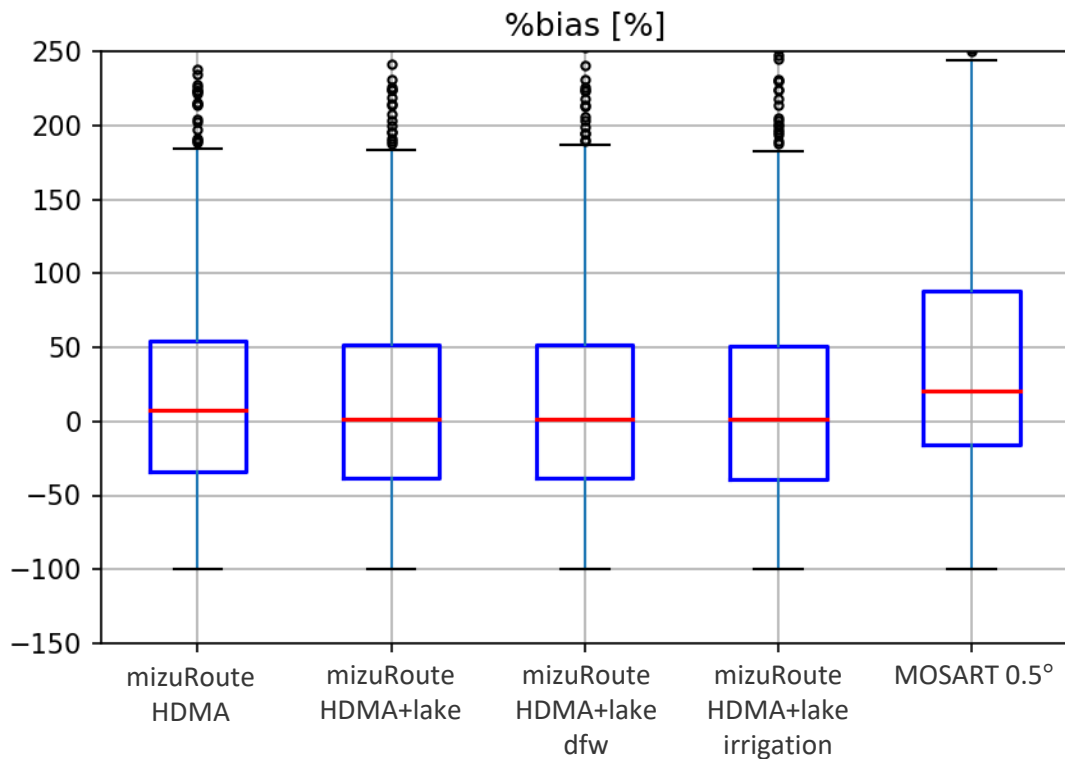

— mizuRoute HDMA+lake

— mizuRoute HDMA+lake diffusive wave

— MOSART 0.5°

● D19

# Monthly discharge bias (1960-1999)

Using all D19 reference sites.

MOSART 0.5° runs: More sites have higher positive bias.

Main error sources: runoff error and drainage area

dfw==diffusive wave routing, including pressure gradient (water height) effect on river flow, with friction coef. = 0.01

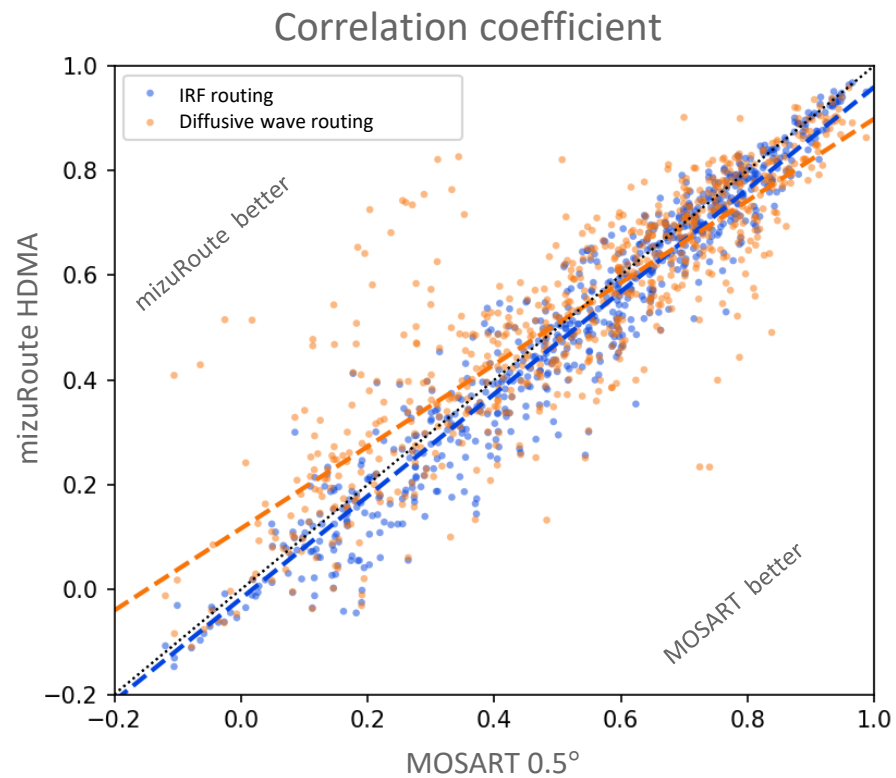

# Drainage area error and flow bias

0.5° network does not resolve smaller river basin.

Flow difference = mizuRoute flow - MOSART flow

# Daily discharge (1960-1999)

fitness metrics: daily observation at B14 daily gauges

# Timing

## Factors affecting the timing (default MOSART vs mizuRoute):

### History outputs

- MOSART: 2D grid output including the whole globe.
- mizuRoute: vector output including land-only.

### Process representations

- MOSART: 3 processes (overland, tributary, & channel routing).
- mizuRoute: 2 processes (overland & channel routing).

### Routing methods

- MOSART: explicit method (using fixed small step).
- mizuRoute: Impulse Response Function (cheap and time step independent).

### Parallelization

- MOSART: Round-Robin partition.
- mizuRoute: hybrid (complicated).

# Adding Floodplain (working in progress)

Low flow

High flow

No floodplain

← Bankfull-width →

floodplain

Bankfull-width

<https://en.wikipedia.org/wiki/Elbe>

# SUMMARY

- ❑ Monthly (or longer) time scales
  - Accurate drainage areas must.
  - Lakes can affect seasonality and bias.
  - Catchment based river network (mizuRoute) can capture drainage areas and shapes effectively than gridded network (MOSART).
  - Higher resolution of gridded network can improve drainage areas, but increase computing time.
  
- ❑ Daily time scale -> important for hydrologic study applications.
  - Routing methods (and channel parameter) matters
  
- ❑ Convinced to move from MOSART to mizuRoute??

# Work needed for CESM3 and beyond

- Need to account for lake evaporation and precipitation input
- River network development for Greenland and Antarctica
- Coupling with the ocean component
- Tracers for heat, DOMs, and isotope (paleo)
- Develop paleo river network and tools

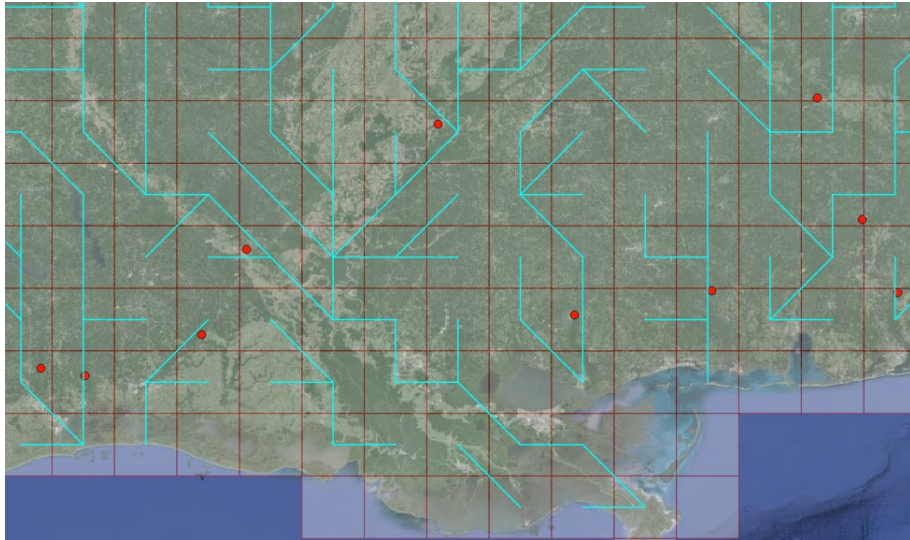

# Near-term scientific research topics

- Re-evaluating discharge to the oceans – Annual volumes, seasonality and long-term trend.
- Evaluation of historical lake volume based on observations (where available) and long-term trends and projections.
- River channel geometry estimates and their impacts on discharges

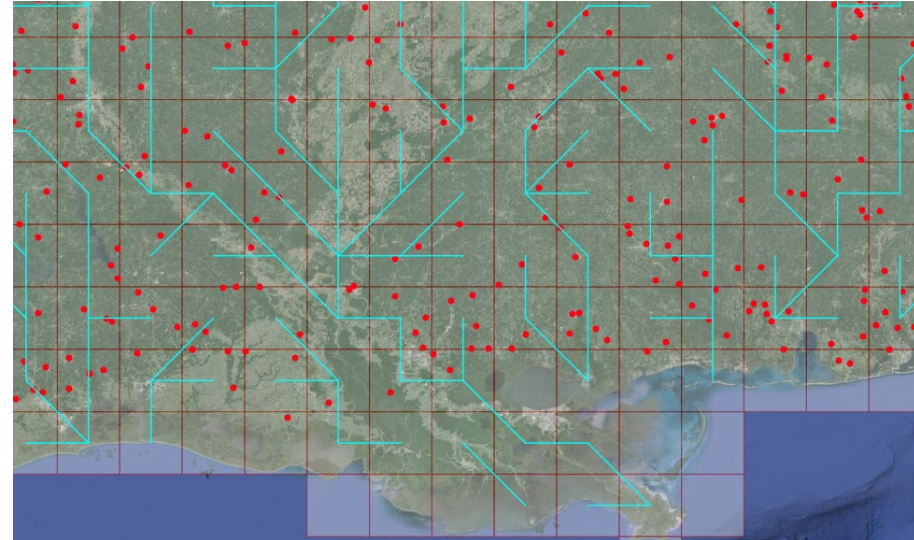

# Reference sites on MOSART 0.5

D19 sites on MOSART 0.5°

River Flow (QCHANR) [Model1](#) vs [Model2](#)

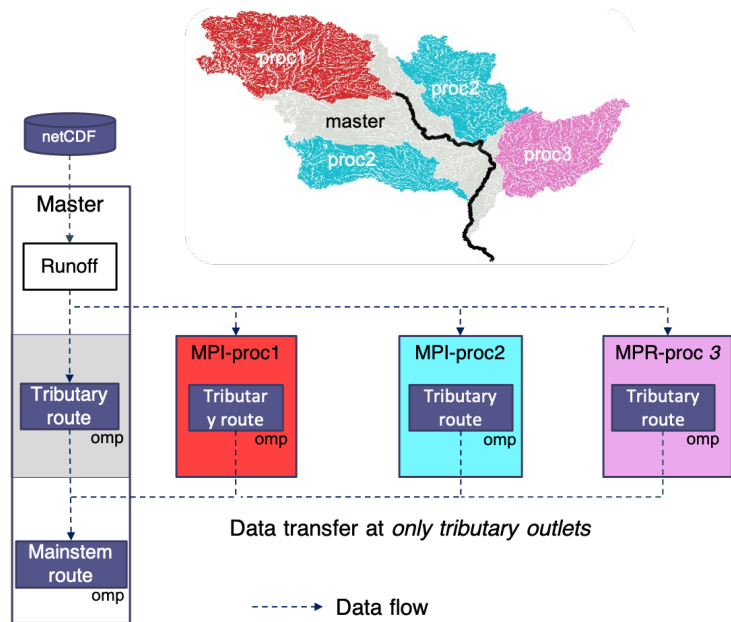

# MOSART vs mizuRoute

## model physics and numerical solution

	MOSART	mizuRoute
Discharge equation	Manning equation	Impulse Response Function
Numerical solution	Euler, explicit, operator splitting (continuity equation)	Euler, explicit, operator splitting (continuity equation)
routing time step	1hr	1day
coupling time step	3hr	1 day

# mizuRoute

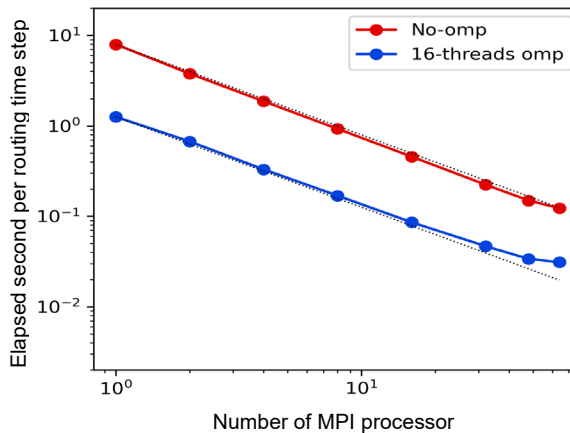

- River network, topological-based routing model (in contrast to gridded routing model)
- Hybrid parallel computing (MPI + openMP)
- Multiple routing schemes

Scaling for routing over global

Scaling for routing over Mississippi

# Lake discharge model

Lake discharge models: parametric or data driven

	Feature	Source
<b>endorheic</b>	no discharge	-
<b>D03</b>	$Q = a(S - S_0) \left( \frac{S - S_0}{S_{max} - S_0} \right)^b$	Doll et al, 2003
<b>H06</b>	Complex (13 parameters, monthly demands), demand based operation	Hanasaki et al., 2006
<b>HYPE</b>	Less complex (15 parameters), zone based-hydropower operation	Arheimer et al., 2019
<b>Target Volume</b>	Data driven, useful for data assimilation	-

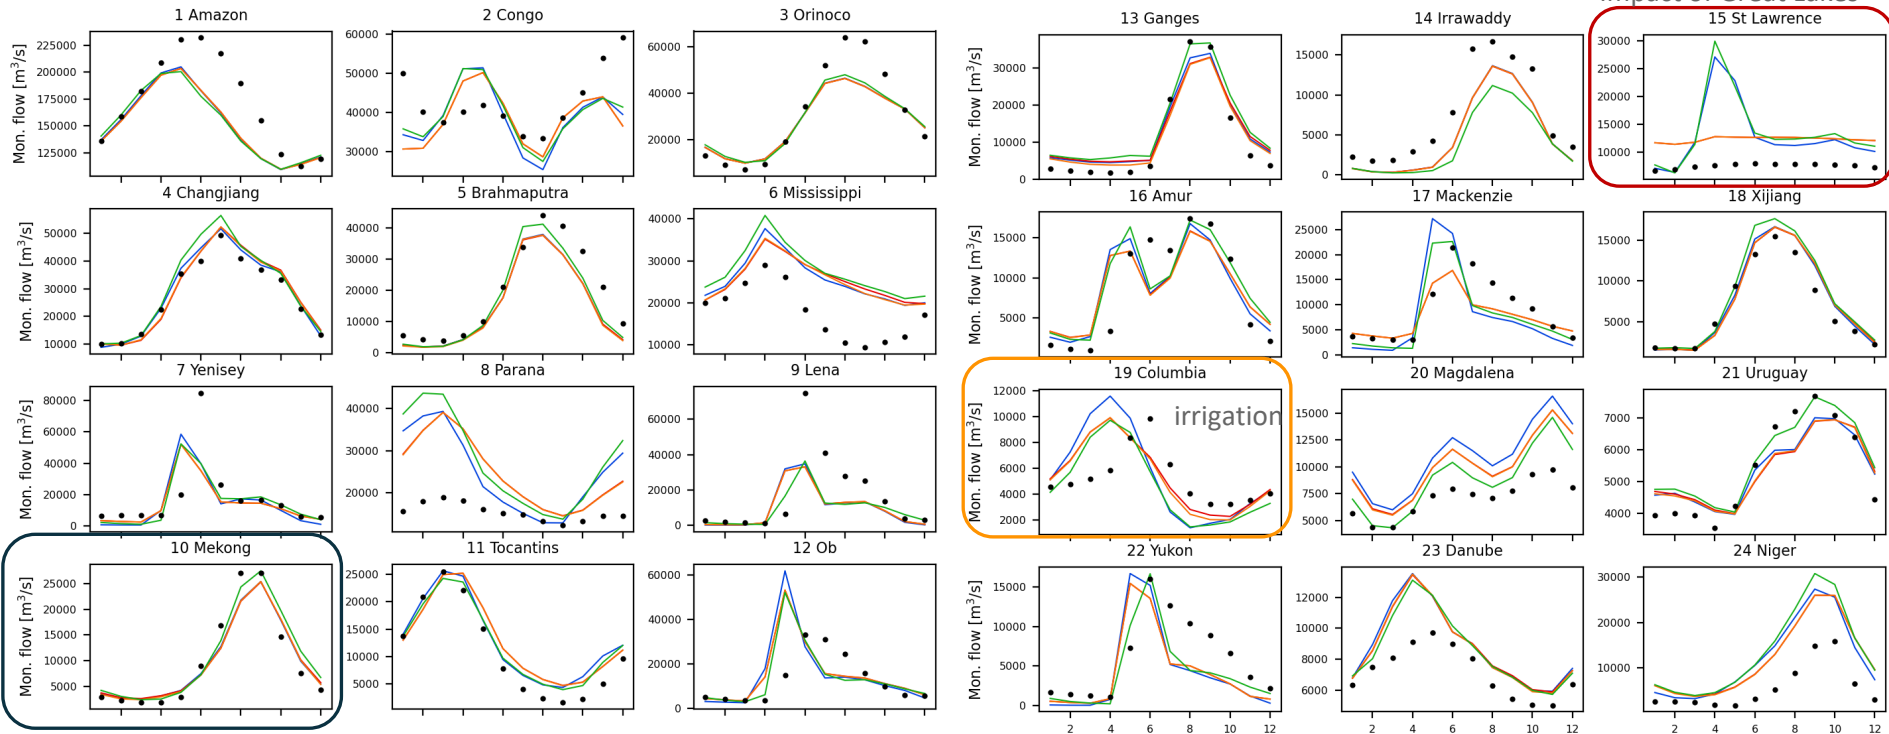

# Summary

- Discharge difference at monthly (or longer) scale is mainly due to drainage area difference, contributing difference in volume bias. Routing physics have minor impacts for coarse time scale. Lakes do affect seasonality and bias.
- MOSART  $0.5^\circ$  is too coarse to resolve small basins, leading overestimation of discharge for those basins. Increasing resolution (e.g.  $0.125^\circ$ ) could resolve this to some degree, but increase significant computing time.
- For mizuRoute, plan to move from the most simple routing-Impulse response Function to the more physical-based routing method to improve fidelity of river flow physics and facilitate other physical process implementation (e.g., floodplain).

# Seasonality (1960-1999)

## Impact of Great Lakes

No lake impact!  
Missing lots of dams
