damrhein@ucar.edu

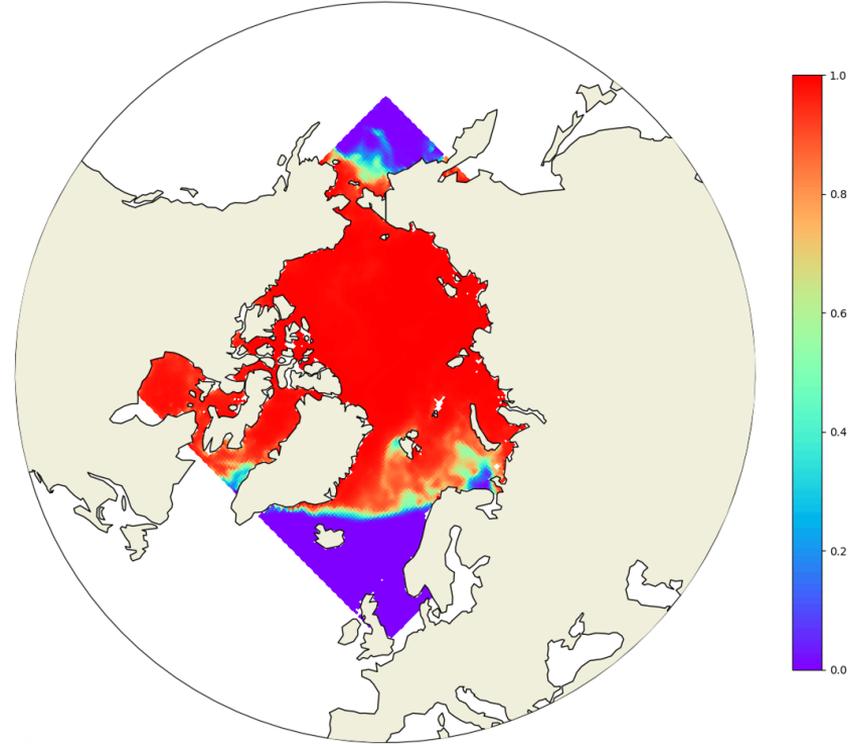

Priorities this year:

- Continued development and support of CrocoDash (Manish)
- Development of OBC capabilities for CICE (Dave Bailey)
- Cycling DA and OSSEs using DART (Helen Kershaw, Kate Boden)
- More complete diagnostics: expanding mom6 -tools for regional use (Mike's talk)
- CESM integration (including downscaling) and testing (Manish, Alper)
- Continued collaboration on near -real-time ocean obs database with WHOI collaborators (Enrico's talk)

Sea Ice Concentration - Month 1

Basic CrocoDash Tutorial

Set up a basic regional ocean run!

A typical workflow of utilizing CrocoDash consists of four main steps:

1. Generate a regional MOM6 domain.
2. Create the CESM case.
3. Process case forcing data.
4. Run the case.

The

Grid Generation (Horizontal, Vertical, Topography)

Model Interaction

SECTION 1: Generate a regional MOM6 domain

Forcing Configuration and Processing

We begin by defining a regional MOM6 domain using CrocoDash. To do so, we first generate a horizontal grid. We t... Finally, we define a vertical grid.

Step 1.1: Horizontal Grid

```
[ ]: from CrocoDash.grid import Grid

grid = Grid(
    resolution = 0.05, # in degrees
    xstart = 278.0, # min longitude in [0, 360]
    lenx = 3.0, # longitude extent in degrees
    ystart = 7.0, # min latitude in [-90, 90]
    leny = 3.0, # latitude extent in degrees
    name = "panama1",
)
```

Towards CrocoDash Version 1

Flexibility

.forcing_configurations:[REQUIRED] Activating BGCIC
.forcing_configurations:[REQUIRED] Activating BGCIronForcing
.forcing_configurations:[OPTIONAL] Activating BGCRiverNutrients
```

Adding Forcing Configurations

This guide explains how to add a new forcing configuration to CrocoDash. Forcing configurations have a setup of different components like tides, biogeochemistry, rivers, and more.

Overview

The forcing configuration framework in `forcing_configurations.py` uses a declarative, registry-based approach:

- **BaseConfigurator** - Abstract base class that all forcing configurations inherit from
- **@register decorator** - Automatically registers configurators in `ForcingConfigRegistry`
- **Input/Output Parameters** - Declarative metadata that describe what data a configurator needs, what case parameters it modifies

Adding a New Dataset

Step 1: Create a New Dataset File

Create a new Python file in `CrocoDash/raw_data_access/datasets/` named after your data product. See other data products for standards

```
# CrocoDash/raw_data_access/datasets/my_dataset.py

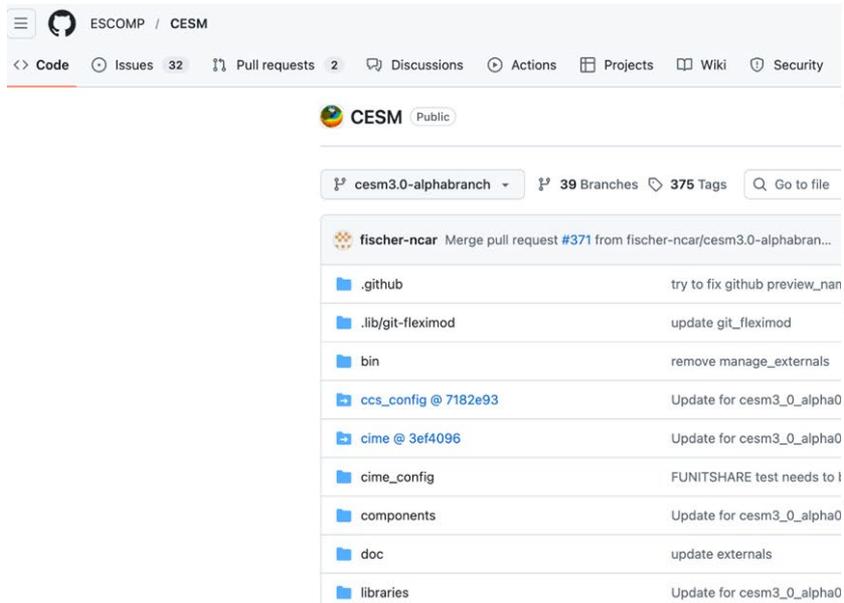

from pathlib import Path
from typing import Tuple, Optional
import xarray as xr
from CrocoDash.raw_data_access.base import ForcingProduct # Could be not a forcing product type
import requests

class MyDataset(ForcingProduct):
    """
    Access data from MyDataSource.

    This class downloads and caches data from MyDataSource for use in CrocoDash.
    """
```

```
./extract_forcings> python driver.py --all --skip runoff tides chl
```

CESM Interfacing

The image shows the **visualCaseGen** application interface. At the top left, the title is **visualCaseGen** and there is a **? Help** button. Below the title bar, there are three main sections: **1. Component Set**, **2. Grid**, and **3. Launch**. Under the **1. Component Set** section, there is a **Configuration Mode:** label with two buttons: **Standard** and **Custom**. To the right of the **1. Component Set** section are two buttons: **Info** and **Proceed**. A terminal window is overlaid on the right side of the interface, displaying the following code:

```
case = Case(  
    cesmroot = cesmroot,  
    caseroot = caseroot,  
    inputdir = inputdir,  
    ocn_grid = grid,  
    ocn_vgrid = vgrid,  
    ocn_topo = topo,  
    project = 'NCGD0011',  
    override = True,  
    machine = "derecho",  
    compset = compset,  
    atm_grid_name = "T62"  
)
```

Below the code, the terminal shows the following output:

```
[16]  
... INFO: initialize:Initializing the visualCaseGen system...  
INFO: csp_solver:CspSolver initialized.
```

)
```

The idea behind this package is that it should let the user sidestep some of the model to run in the first place. This removes some of the steep learning curve of MOM6. Note that the resultant model configuration might still need some tweaking to avoid CFL-related numerical stability issues or fiddling with bathymetry for fjords or channels that may exist).

CROCODILE-CESM

Regional ocean and carbon cycle modeling and data assimilation within the Community Earth System Model

Follow

README.md

CROCODILE: Python interfaces for regional ocean modeling and data assimilation

CROCODILE is an [NSF-funded cyberinfrastructure](#) collaboration between the NSF National Center for Atmospheric Research ([NSF NCAR](#)) and the Woods Hole Oceanographic Institution ([WHOI](#)).

Our goal is to build a community of practice around regional ocean modeling for studying ocean physics, the carbon cycle, climate change and intervention, and more, by creating and curating a common set of open-source tools.

We want YOU to be up and running a regional ocean model, with all the necessary forcing files, boundary conditions, etc., for fairly arbitrary domains and model resolutions, including data assimilation capabilities, in a matter of hours rather than weeks!

CROCODILE combines

- The [MOM6](#) ocean model
